Passport to Algebra and Geometry Barbara L. Power, Holt McDougal, Rita Browning, 2004 Children's Books in Print, 2007, 2006 *Geometry, Grade 10 Notetaking Guide* Holt McDougal, 2003 **The Software Encyclopedia**, 1986

Percent: Grade 6 Workbook Maria Miller, 2016-10-06 In *Percent Grade 6 Workbook* we study the concept of percentage which builds on the student's understanding of fractions and decimals. Specifically, students should be very familiar with the idea of finding a fractional part of a whole such as finding $\frac{3}{4}$ of 240. Assuming the student has mastered how to find a fractional part of a whole and can easily convert fractions to decimals, then studying the concept of percentage should not be difficult. The first lesson, *Percentage*, practices the concept of percentage as a hundredth part and how to write fractions and decimals as percentages. Next, we study how to find a percentage when the part and the whole are given, for example, if 15 out of 25 club members are girls, what percentage of them are girls. The following two lessons have to do with finding a certain percentage of a given number or quantity. First, we study how to do that using mental math techniques. For example, students find 10% of 400 by dividing 400 by 10. Next, students find a percentage of a quantity using decimal multiplication, both manually and with a calculator. For example, students find 17% of 45 km by multiplying 0.17 $\times$ 45 km. I prefer teaching students to calculate percentages of quantities using decimals instead of using percentage proportion or some other method such as changing 17% into the fraction $\frac{17}{100}$ for calculations. That is because using decimals is simpler; we simply change the percentage into a decimal and multiply instead of having to build a proportion or use fractions. Also, decimals will be so much easier to use later on when solving word problems that require the usage of equations. Next is a lesson about discounts, which is an important application from everyday life. Then we go on to the lesson *Practice with Percentage*, which contrasts the two types of problems students have already studied: questions that ask to calculate a given percentage of a number and questions that ask to find the percentage. For example, the first type of question could be "What is 70% of 380?" and the second type could be "What percentage is 70 of 380?" The last lesson lets students find the total when the percentage and the partial amount are known. For example, "Three hundred twenty students, which is 40% of all students, take PE. How many students are there in total?" We solve these with the help of bar models. **Spectrum Math, Grade 6** Spectrum, 2007-02-01
