

Generate a Calibration Curve for Chlorophyll a

Purpose

To measure and graph the absorbance of light by chlorophyll at a specific wavelength (the absorbance maximum) versus chlorophyll concentration. Students will be given an unknown and determine its concentration from their calibration curve.

Overview

This exercise is designed to familiarize the student with the concept of spectroscopy or the study of the interaction of matter with electromagnetic radiation. Students will prepare solutions and use a colorimeter to measure absorbance by solutions of different concentrations.

Time

One class period.

Key Concepts

Matter absorbs electromagnetic radiation.

Absorbance is proportional to concentration and this relationship can be expressed mathematically (Beer's Law $A=abc$).

Scientists can use this relationship to measure concentrations of solutions if a calibration curve is generated.

Skills

Collecting data

Preparing serial dilutions

Making observations

Graphing data

Forming hypotheses

Materials

Mortar and pestle or glass blender (do not use plastic if you will be using nail polish remover as a solvent)

Spinach or dried algae preparations (can be obtained from health food store as dietary supplement. About five capsules will do)

Nail polish remover (**acetone or ethyl acetate**) or **ethanol or rubbing alcohol** (30 - 50 mL)

Balance

Erlenmeyer flask (or a jelly jar)

Funnel

Filter paper (or coffee filters)

Graduated cylinder (50 mL)

Vernier colorimeter interfaced to a CBL system.

Cuvetts

5 mL graduated pipettes and pipette bulbs

Heme, Chlorophyll, and Bilins Alison Smith, Michael Witty, 2008-06-07 In Heme Chlorophyll and Bilins Methods and Protocols an interdisciplinary panel of hands on investigators describe in detail how to work successfully with chlorophyll heme and bilins in biological medical chemical and biochemical research Each method is presented by a researcher who actually uses it on a daily basis and includes step by step instructions and pertinent tricks of the trade that often make the difference between laboratory success and failure Topics range from methods for the analysis of tetrapyrroles heme and hemoproteins to the biosynthesis and analysis of chlorophyll and bilins **A Handbook for the Measurement of Chlorophyll a and Primary Production** C. Rebeiz, 2013-10-28 Heme and chlorophyll Chl are porphyrins Porphyrins also referred to as tetrapyrroles are essential for life in the biosphere Chlorophyll catalyzes the conversion of solar energy to chemical energy via the process of photosynthesis Organic life in the

biosphere is made possible by consumption of the chemical energy generated by photosynthesis. Hemes are the prosthetic groups of cytochromes which are involved in electron transport during oxidative phosphorylation and photosynthetic phosphorylation which generate ATP and NADPH. The latter are essential for many cellular functions. Chlorophyll, on the other hand, catalyzes the process of photosynthesis. Indeed, life in the biosphere depends on the process of photosynthesis which converts light energy, carbon dioxide, and water into the chemical energy required for the formation of food and fiber. Photosynthetic efficiency is controlled by extrinsic factors such as the availability of water, CO₂, inorganic nutrients, ambient temperature, and the metabolic and developmental state of the plant, as well as by intrinsic factors (Lien and San Pietro 1975). The most important intrinsic factor is the efficiency of the photosynthetic electron transport system (PETS). Conventional agriculture is one of the few human activities that have not undergone a revolution to join other activities such as overcoming gravity by flying and landing on the moon, crossing underwater, the polar cap, and communicating wirelessly over long distances via electromagnetic waves. We now feel that enough biochemical and molecular biological knowledge has accumulated to render this dream amenable to experimentation. We believe that the time has come to bioengineer chloroplasts capable of synthesizing a short chain carbohydrate such as glycerol at rates that approach the upper theoretical limits of photosynthesis.

Rebeiz C A 2010 Investigations of possible relationships between the chlorophyll biosynthetic pathway and the assembly of chlorophyll protein complexes and photosynthetic efficiency. In Rebeiz C A, Benning C, Bohnert H J, Daniell H, Hooper J K, Lichtenthaler H K, Portis A R, and Tripathy B C eds. *The chloroplast: Basics and Applications*. Springer, The Netherlands, p 1-24. In order to achieve this goal, a thorough knowledge of the Chl biosynthetic pathway is needed, along with knowledge in other domains. Rebeiz 2010. In this context, this monograph is devoted to an in-depth discussion of our present knowledge of the Chl biosynthetic pathway. The complexity and biochemical heterogeneity of the Chl biosynthetic pathway and the relationship of this complexity to the structural and biosynthetic complexity of photosynthetic membranes will be emphasized. We will also emphasize, in historical perspective, key stages in our understanding of the Chl biosynthetic heterogeneity. The reader should keep in mind that a complex biosynthetic process is only fully understood when it becomes possible to reconstitute in vitro every step of the process. We are not yet at this stage of understanding of thylakoid membrane biogenesis. Considerable progress has been achieved, however, in the understanding of numerous facets of the Chl biosynthetic pathway, namely: a) detection and identification of various major and minor metabolic intermediates, b) precursor-product relationships between various intermediates, c) structure and regulation of many enzymes of the pathway, and d) the relationship of the Chl biosynthetic heterogeneity to the structural and functional heterogeneity of thylakoid membranes. In addition, topics related to the development of analytical techniques, cell-free systems, herbicides, insecticides, and cancericides are also discussed.
