

Molecular/Mendelian Genetics

DNA Structure

Polymer of _____ that consists of a _____ group, _____, and _____, containing _____

DNA Replication

DNA replicates just before _____ division. _____ unwinds the DNA, _____ polymerase adds DNA nucleotides, and _____ forms the _____ fragments on the _____ strand. The _____ strand is always replicated _____ the replication fork and the _____ strand is replicated _____ from the fork.

Meiosis

The process in which a _____ (2N) cell yields _____ identical _____ (1N) cells. DNA replication occurs during _____. This phase is followed by _____, and _____. An "X" structure is called a _____ and each side of the X is a _____.

Significant Experiments

_____ (Mice & bacterial transformation)
_____ & _____ (Viruses - DNA vs Protein)
_____ (Base pairing rules)
_____ & _____ (DNA Structure)

Sexual Reproduction

Offspring result from the combination of two _____ cells. One parent donates a set of chromosomes and the other parent donates a set of chromosomes that are _____ to the first set. This way, the offspring's cells will be _____ or will contain the "normal" chromosome number for that species.

Meiosis

Meiosis is the process in which 1 _____ cell yields _____ unique, haploid cells. During meiosis, _____ form during Prophase I. This is also called _____ and is the pairing of _____ chromosomes. At this time _____ & _____ chromosomes may or may not _____ over. During Anaphase I, it is the _____ & _____ chromosomes that assort (or split) randomly. This is Mendel's 2nd Law, the Law of _____. Assortment. The fact that the maternal and paternal chromosomes (Aa, _____ chromosomes) are separating at this point (A from a), supports Mendel's first law, the Law of _____. Meiosis ensures that each _____ will only contain 1 copy of each _____ chromosome. For example, a normal human baby should never receive two copies of chromosome 21 from one parent. This can, in fact, happen if homologous chromosomes do not separate properly during Anaphase _____ or the chromatids do not separate during Anaphase _____. This mistake is called a _____. Trisomy 21 (baby has 3 copies of chrom. 21) is known as _____ syndrome. _____ syndrome and _____ syndrome result from a non-disjunction of the _____ chromosome.

Gene to Protein (Protein Synthesis)

The purpose of a _____ (segment of DNA) is to provide cells with a code to make a specific _____. The first process in which mRNA is copied from one strand of DNA (the gene) is called _____. The mRNA then undergoes processing for _____ cells only. The mRNA heads to the _____ of the cell where the _____ cap binds to the _____ ribosomal subunit. Corresponding _____ tRNAs are then signaled to carry and line up specific _____, & _____ bond is then formed between the amino acids to produce a finished _____.

Phenotypic Plasticity & Evolution David W. Pfennig, 2021-05-31 Phenotypic plasticity, the ability of an individual organism to alter its features in direct response to a change in its environment, is ubiquitous. Understanding how and why this phenomenon exists is crucial because it unites all levels of biological inquiry. This book brings together researchers who approach plasticity from diverse perspectives to explore new ideas and recent findings about the causes and consequences of plasticity. Contributors also discuss such controversial topics as how plasticity shapes ecological and evolutionary processes, whether specific plastic responses can be passed to offspring, and whether plasticity has left an important imprint on the history of life. Importantly, each chapter highlights key questions for future research. Drawing on numerous studies of plasticity in natural populations of plants and animals, this book aims to foster greater appreciation for this important but frequently misunderstood phenomenon.

Key Features Written in an accessible style with numerous illustrations, including many in color. Reviews the history of the study of plasticity, including Darwin's views. Most chapters conclude with recommendations for future research.

Philosophy of Cancer Marta Bertolaso, 2016-08-24 Since the 1970s, the origin of cancer is being explored from the point of view of the Somatic Mutation Theory (SMT), focusing on genetic mutations and clonal expansion of somatic cells. As cancer research expanded in several directions, the dominant focus on cells remained steady, but the classes of genes and the kinds of extra-genetic factors that were shown to have causal relevance in the onset of cancer multiplied. The wild heterogeneity of cancer-related mutations and phenotypes, along with the increasing complication of models, led to an oscillation between the hectic search of the few key factors that cause cancer and the discouragement in face of a seeming endless complexity. To tame this complexity, cancer research started to avail itself of the tools that were being developed by Systems Biology. At the same time, anti-reductionist voices began claiming that cancer research was stuck in a sterile research paradigm. This alternative discourse even gave birth to an alternative theory, the Tissue Organization Field Theory (TOFT). A deeper philosophical analysis shows limits and possibilities of reductionist and anti-reductionist positions and of their polarization. This book demonstrates that a radical philosophical reflection is necessary to drive cancer research out of its impasses. At the very least, this will be a reflection on the assumptions of different kinds of cancer research, on the implications of what cancer research has been discovering over 40 years, and more, on a view of scientific practice that is most able to make sense of the cognitive and social conflicts that are seen in the scientific

community and in its results and finally on the nature of living entities with which we entertain this fascinating epistemological dance that we call scientific research The proposed Dynamic and Relational View of carcinogenesis is a starting point in all these directions

Heredity under the Microscope Soraya de Chadarevian, 2020-07-02 By focusing on chromosomes *Heredity under the Microscope* offers a new history of postwar human genetics Today chromosomes are understood as macromolecular assemblies and are analyzed with a variety of molecular techniques Yet for much of the twentieth century researchers studied chromosomes by looking through a microscope Unlike any other technique chromosome analysis offered a direct glimpse of the complete human genome opening up seemingly endless possibilities for observation and intervention Critics however countered that visual evidence was not enough and

pointed to the need to understand the molecular mechanisms Telling this history in full for the first time Soraya de Chadarevian argues that the often bewildering variety of observations made under the microscope were central to the study of human genetics Making space for microscope based practices alongside molecular approaches de Chadarevian analyzes the close connections between genetics and an array of scientific medical ethical legal and policy concerns in the atomic age By exploring the visual evidence provided by chromosome research in the context of postwar biology and medicine Heredity under the Microscope sheds new light on the cultural history of the human genome Biological & Agricultural Index ,1928
