

Assignment 2 – Plate Tectonics and the Origin of Volcanic Igneous Rocks

Objectives

1. Understand how stress, friction, and plate interactions determine if Earth's surface features, including or shaping the seas.

2. Understand and explain formation of plate tectonic processes

3. How physical and geological models of our world help us to see that volcanic activity is primarily a process, dependent on time and place examples.

Introduction

Plate tectonics is the science of how the earth's large, rigid plates move together to create visible, large-scale features such as ridges, trenches, and mountain ranges. These features are the result of plate interactions, which are driven by forces such as mantle convection, ridge pushing, and slab pulling. The theory of plate tectonics is the result of combining geological and geophysical data to create a model of the earth's crust and upper mantle.

One of the most important concepts in plate tectonics is the idea of a plate boundary. A plate boundary is a line where two plates meet. There are three types of plate boundaries: divergent, convergent, and transform. At a divergent boundary, two plates move apart, creating a mid-ocean ridge. At a convergent boundary, two plates move together, creating a trench or a mountain range. At a transform boundary, two plates slide past each other horizontally. The theory of plate tectonics explains how these boundaries are formed and how they move.

History

The theory of plate tectonics was first proposed in the 1920s by Alfred Wegener. He proposed that the continents were once joined together in a single supercontinent called Pangea. Over time, the supercontinent broke apart, and the continents drifted apart. This theory was initially met with skepticism, but it was later supported by evidence from the 1950s and 1960s.

Plate boundaries

There are three types of plate boundaries: divergent, convergent, and transform. At a divergent boundary, two plates move apart, creating a mid-ocean ridge. At a convergent boundary, two plates move together, creating a trench or a mountain range. At a transform boundary, two plates slide past each other horizontally. The theory of plate tectonics explains how these boundaries are formed and how they move.

Below is a diagram of the earth's crust showing the three types of plate boundaries and how they move.
