# PRACTICE PAPER FOR

## Edexcel Paper 3H (June 2023)

### Disclaimer

In 2022 I wrote a series of predicted papers that in many cases reflected the real exam paper very well. This was due to the exam boards providing advance information on the topics that were going to be in each paper. This information is no longer provided so "predicting" a paper is not possible. Nobody can know what topics and types of questions will come up in each paper, apart from the few examiners that write them.

This paper has been created based on the **most common** paper 2/3 topics from previous years as well as careful analysis of the topics that have already appeared in paper 1/2. The paper should be excellent at helping students revise for exams, however should not be relied upon as the basis for revision. The topics from this paper may well appear in the real exams, however there is absolutely no guarantee of this for the reasons previously mentioned. Some topics may appear, some may not.

Ultimately the best way to prepare for the exams is to **revise all topics**.

**The J-Matrix Method** Abdulaziz D. Alhaidari, Eric J. Heller, Hashim A. Yamani, Mohamed S. Abdelmonem, 2008-03-20 Although introduced 30 years ago the J matrix method has witnessed a resurgence of interest in the last few years In fact the interest never ceased as some authors have found in this method an effective way of handling the continuous spectrum of scattering operators in addition to other operators The motivation behind the introduction of the J matrix method will be presented in brief The introduction of fast computing machines enabled theorists to perform calculations although approximate in a conveniently short period of time This made it possible to study varied scenarios and models and the effects that different possible parameters have on the results of such calculations The first area of research that benefited from this opportunity was the structural calculation of atomic and nuclear systems The Hamiltonian element of the system was set up as a matrix in a convenient finite bound state like basis A matrix of larger size resulted in a better configuration interaction matrix that was subsequently diagonalized The discrete energy eigenvalues thus obtained approximated the spectrum of the system while the eigenfunctions approximated the wave function of the resulting discrete state Structural theorists were delighted because they were able to obtain very accurate values for the lowest energy states of interest
