

9.4 Applications of Contour Lines on Topographic Maps

In the last few sections, you learned how to read contour lines and how to use the "rules" for reading contour lines are now out for you to use in Exercises 9.1, 9.2, and 9.3. In this section, you will learn what you have learned. In later chapters, you will learn how to use the data provided by contour lines to assess how different agents of erosion have shaped the landscape.

EXERCISE 9.4

Rules for Reading Contour Lines on Topographic Maps

Name _____

Course _____

Complete the following sentences to summarize what you've learned about contour lines.

- Two different contour lines cannot cross because _____.
- The spacing between contour lines on a map reveals the _____ of the terrain. Closely spaced contour lines indicate a _____ slope, and widely spaced contour lines indicate a _____ slope.
- Concentric contour lines indicate a _____.
- Concentric hachured contour lines indicate a _____.

9.4 Applications of Contour Lines on Topographic Maps

Topographic maps help geologists and other scientists trace the spread of earthquakes and volcanoes. In later chapters, you will learn how to use the data provided by contour lines to assess how different agents of erosion have shaped the landscape.

In Exercise 9.5 you will make a topographic map of a small area of land. The data provided by contour lines can be a life-saving skill.

9.5 Making a Topographic Map

9.5 Making a Topographic Map

Section _____
Date _____

Contour lines of 20, 40, 60, and 80 feet will be on your map. The 20-foot contour line will be the first contour line you draw. You will have to draw the other contour lines between the other contour points.

Survival of the Fittest (Those Who Can Read a Topographic Map)

Section _____

Date _____

You and a friend are near the northeast corner of an island at the spot indicated on the map. There are a lighthouse keeper and his family living on the opposite side of the island. Unfortunately, the lighthouse keeper has been killed during the crash, and your cell phones don't work. The lighthouse keeper's son is to walk to the lighthouse. You are injured in the crash and can't climb higher than 75 feet or swim across the water. The lighthouse keeper's son can't swim and can't carry enough water to last 3 days. It gets worse: the island has no fresh water, there's a huge volcano on the island, and the jungle is filled with snakes, tigers, and lions. The good news is that you have a topographic map showing these hazards. You have figured out exactly where the plane crashed, and the map also shows a well where you can refill your canteens—if you can get there in 3 days.

Modern Volcano

Monitoring Zack Spica, Corentin Caudron, 2025-09-21 This book describes the different tools that have been developed during the last decades to explain how scientists study volcanoes. It takes into consideration volcanology as being a complex field at the interface between geology, geochemistry, and geophysics and provides information about these aspects to embrace the diversity of a volcanic system. The book also provides an outlook to which direction this research is leading. It offers a hands-on experience directly useful if the reader wants to start applying the principles exposed.

Magma to Microbe

Robert P. Lowell, Jeffrey S. Seewald, Anna Metaxas, Michael R. Perfit, 2013-04-30 *Magma to Microbe* Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 178. Hydrothermal systems at oceanic spreading centers reflect the complex interactions among transport, cooling, and crystallization of magma, fluid circulation in the crust, tectonic processes, water-rock interaction, and the utilization of hydrothermal fluids as a metabolic energy source by microbial and macrobiological ecosystems. The development of mathematical and numerical models that address these complex linkages is a fundamental part of the RIDGE 2000 program that attempts to quantify and model the transfer of heat and chemicals from the mantle to microbes at oceanic ridges. This volume presents the first state-of-the-art picture of model development in this context. The most outstanding feature of this volume is its emphasis on mathematical and numerical modeling of a broad array of hydrothermal processes associated with oceanic spreading centers. By examining the state of model development in one volume, both cross-fertilization of ideas and integration across the disparate disciplines that study seafloor hydrothermal systems is facilitated. Students and scientists with an interest in oceanic spreading centers in general and more specifically in ridge hydrothermal processes will find this volume to be an up-to-date and indispensable resource.
