The Electronic Design Automation Handbook Dirk Jansen, 2010-02-23 When I attended college we studied vacuum tubes in our junior year At that time an average radio had ve vacuum tubes and better ones even seven Then transistors appeared in 1960s A good radio was judged to be one with more thententransistors Later good radios had 15 20 transistors and after that everyone stopped counting transistors Today modern processors runing personal computers have over 10milliontransistors and more millions will be added every year The difference between 20 and 20M is in complexity methodology and business models Designs with 20 tr sistors are easily generated by design engineers without any tools whilst designs with 20M transistors can not be done by humans in reasonable time without the help of Prof Dr Gajski demonstrates the Y chart automation This difference in complexity introduced a paradigm shift which required sophisticated methods and tools and introduced design automation into design practice By the decomposition of the design process into many tasks and

abstraction levels the methodology of designing chips or systems has also evolved Similarly the business model has changed from vertical integration in which one company did all the tasks from product specification to manufacturing to globally distributed client server production in which most of the design and manufacturing tasks are outsourced **An**

Vingron, 2012-03-30 In three main divisions the book covers combinational circuits latches and asynchronous sequential circuits Combinational circuits have no memorising ability while sequential circuits have such an ability to various degrees Latches are the simplest sequential circuits ones with the shortest memory The presentation is decidedly non standard The design of combinational circuits is discussed in an orthodox manner using normal forms and in an unorthodox manner using set theoretical evaluation formulas relying heavily on Karnaugh maps The latter approach allows for a new design technique called composition Latches are covered very extensively Their memory functions are expressed mathematically in a time independent manner allowing the use of normal non temporal Boolean logic in their calculation The theory of latches is then used as the basis for calculating asynchronous circuits Asynchronous circuits are specified in a tree representation each internal node of the tree representing an internal latch of the circuit the latches specified by the tree itself The tree specification allows solutions of formidable problems such as algorithmic state assignment finding equivalent states non recursively and verifying asynchronous circuits **Handbook for Electrical Engineers** Harold Pender, William Arthur Del Mar, 1922
