The transistor was far superior to the vacuum tube, allowing computers to become smaller, faster, cheaper, more energy-efficient and more reliable than their first-generation predecessors. Second-generation computers relied on punched cards for input and printouts for output. Assembly language which allowed programmers to specify instructions in words, introduced as second generation language</p> <p>Then IBM-7094-a faster and larger computer came into picture. In that, control cards were in use. In this system, cards were arranged as a stack to save CPU time. All these cards were then read one by one and copied onto a tape using a 'card to tape' utility program. The prepared tape was taken to the main computer and processed.</p> <ul style="list-style-type: none"><li>• Technology used: Transistor</li><li>• Memory: Magnetic core technology</li><li>• Programming: Assembly level language</li><li>• Example: IBM-1401, IBM-7094, IBM 1620, CDC 3600</li></ul> <p><b>Advantages:</b></p> <ul style="list-style-type: none"><li>• Smaller in size as compared to first generations computers.</li><li>• More reliable.</li><li>• Less heat generated as compared to first generation machine.</li></ul> | Description of each generation- 2M |
