Hydraulics in Civil and Environmental Engineering, 2nd Ed Andrew John Chadwick, John C. Morfett, 1996 **Transport by Pipelines and Its Optimization** Pablo Druetta, Remo Frabotta, Gustavo Luis Cavallo, 2024-12-10 This textbook introduces pipeline design one of the most efficient techniques for mass and energy transport available today The global economy heavily relies on pipelines However designing a pipeline is more complex than it might seem it involves many technical and economic factors that must work together to create an optimized system The book begins with basic concepts of pipelines including a description of the materials used heat transfer between the system and medium and the main components of pumping and compression stations which are vital for the subsequent chapters It then presents a simple yet detailed overview of these factors and introduces a mathematical methodology that combines them to deliver an optimized pipe design minimizing costs and reducing energy consumption The book also covers the transient verification of this design using well known balance equations and material property relationships for both incompressible and compressible fluids to validate the initial design Finally the book explores the analysis of multiphase pipelines where the goal is to transport a particular material e.g solid using a different medium e.g air or water *Tidal Hydraulics* United States.
