

- **Gastrointestinal System:**
 - **Enteral Feeding:** is used when a patient is unable to eat orally
 - **Indications:**
 - Inability to eat due to a medical condition (comatose, intubated, stroke)
 - Inability to maintain adequate oral nutritional intake and need for supplementation due to increased metabolic demands
 - Pathologies that cause difficulty swallowing or increase risk of aspiration
 - **Clinical Presentation:**
 - **Malnutrition:** decreased prealbumin, decreased total iron-binding capacity
 - **Aspiration pneumonia:** food, vomit, etc. is inhaled into the lungs
 - **Complications:**
 - **Overfeeding:** results from infusion of a greater quantity of feeding than can be readily digested, which causes abdominal distention and nausea and vomiting
 - ***Nursing Interventions:***
 - **Check residual volume every 4-6 hours**
 - It is the volume of fluid remaining in the stomach during feeding: if it is high, the patient is not digesting the food (let the doctor know **FIRST**)
 - Ex: patient is on 60 mL, but you aspirate 100 mL
 - Follow protocol for slowing or withholding feeding for excess residual volume: let doctor know and they will tell you to hold the feeding
 - **Check the pump for proper operation and ensure feeding infused at correct rate** (probably would want to make sure that everything works and is running at the correct rate **BEFORE** you do something: assess before doing)
 - **Diarrhea:** occurs secondary to concentration of feeding or its constituents
 - ***Nursing Interventions:***
 - **Slow the rate of feeding and notify the provider**
 - Consult with a dietitian
 - Provide skin care and protection
