

Protein Synthesis: Making new proteins (the hormones and enzymes) for the body. Protein synthesis occurs in two steps and in two areas of the cell. This happens because DNA cannot leave the nucleus of the cell.

Transcription: (writing mRNA = the message of how to make proteins); occurs in nucleus of cell

1. Part of DNA unwinds and creates mRNA (one template) in the nucleus with the help of RNA polymerase.
2. When transcribing from DNA to RNA, Thymine is replaced by Uracil.
3. Only one side of the DNA is transcribed into mRNA.
4. mRNA leaves the nucleus and travels to the ribosome in the cytoplasm.

Translation: (translating for an amino acid); occurs using ribosome floating in the cytoplasm of cells

5. With the help of the ribosome, mRNA is translated.
6. tRNA transfers the complementary anticodon with the amino acid attached to each codon on mRNA.
7. Polypeptide chain is created where each amino acid is joined by a peptide bond = protein.
8. Protein either stays in the cell or gets packaged.

Quick Practice

mRNA codons: _____

tRNA anticodons: _____

Amino Acid Sequence = Protein (use mRNA codon and the chart below to find the amino acid)

READ the mRNA codon, NOT the tRNA anticodon, to find the amino acid!
 Note how UAC (codon) = Tyr (amino acid) and AGU (codon) = Ser (amino acid)

Interactions Saliha Durmuş,Tunahan Çakır,Reinhard Guthke,Emrah Nikerel,Arzucan Özgür,2016-05-30 A thorough understanding of pathogenic microorganisms and their interactions with host organisms is crucial to prevent infectious threats due to the fact that Pathogen Host Interactions PHIs have critical roles in initiating and sustaining infections Therefore the analysis of infection mechanisms through PHIs is indispensable to identify diagnostic biomarkers and next generation drug targets and then to develop strategic novel solutions against drug resistance and for personalized therapy

Traditional approaches are limited in capturing mechanisms of infection since they investigate hosts or pathogens individually. On the other hand, the systems biology approach focuses on the whole PHI system and is more promising in capturing infection mechanisms. Here we bring together studies on the below listed sections to present the current picture of the research on Computational Systems Biology of Pathogen Host Interactions, Computational Inference of PHI Networks using Omics Data, Computational Prediction of PHIs, Text Mining of PHI Data from the Literature, Mathematical Modeling and Bioinformatic Analysis of PHIs. Computational Inference of PHI Networks using Omics Data. Gene regulatory, metabolic, and protein-protein networks of PHI systems are crucial for a thorough understanding of infection mechanisms. Great advances in molecular biology and biotechnology have allowed the production of related omics data experimentally. Many computational methods are emerging to infer molecular interaction networks of PHI systems from the corresponding omics data. Computational Prediction of PHIs. Due to the lack of experimentally found PHI data, many computational methods have been developed for the prediction of pathogen-host protein-protein interactions. Despite being emerging, currently available experimental PHI data are far from complete for a systems view of infection mechanisms through PHIs. Therefore, computational methods are the main tools to predict new PHIs. To this end, the development of new computational methods is of great interest. Text Mining of PHI Data from Literature. Despite the recent development of many PHI-specific databases, most data relevant to PHIs are still buried in the biomedical literature, which demands for the use of text mining techniques to unravel PHIs hidden in the literature. Only some rare efforts have been performed to achieve this aim. Therefore, the development of novel text mining methods specific for PHI data retrieval is of key importance for efficient use of the available literature. Mathematical Modeling and Bioinformatic Analysis of PHIs. After the reconstruction of PHI networks experimentally and/or computationally, their mathematical modeling and detailed computational analysis is required using bioinformatics tools to get insights on infection mechanisms. Bioinformatics methods are increasingly applied to analyze the increasing amount of experimentally found and computationally predicted PHI data.
