Advances in Credit Risk Modeling and Management Frédéric Vrans, 2020-07-01 Credit risk remains one of the major risks faced by most financial and credit institutions. It is deeply connected to the real economy due to the systemic nature of some banks but also because well managed lending facilities are key for wealth creation and technological innovation. This book is a collection of innovative papers in the field of credit risk management. Besides the probability of default PD, the major driver of credit risk is the loss given default LGD. In spite of its central importance, LGD modeling remains largely unexplored in the academic literature. This book proposes three contributions in the field. Ye Bellotti exploits a large private dataset featuring non performing loans to design a beta mixture model. Their model can be used to improve recovery rate forecasts and therefore to enhance capital requirement mechanisms. François uses instead the price of defaultable instruments to infer the determinants of market implied recovery rates and finds that macroeconomic and long term issuer specific factors are the main determinants of market implied LGDs. Cheng Cirillo address the problem of modeling the dependency between PD and LGD using an original urn based statistical model. Fadina Schmidt propose an improvement of intensity based default models by accounting for ambiguity around both the intensity process and the recovery rate. Another topic deserving more attention is trade credit which consists of the supplier providing credit facilities to his customers. Whereas this is likely to stimulate exchanges in general it also magnifies credit risk. This is a difficult problem that remains largely unexplored. Kanapickiene Spicas propose a simple but yet practical model to assess trade credit risk associated with SMEs and microenterprises operating in Lithuania. Another topical area in credit risk is counterparty risk and all other adjustments such as liquidity and capital adjustments known as XVA. Chataignier Crpey propose a genetic algorithm to compress CVA and to obtain affordable incremental figures. Anagnostou Kandhai introduce a hidden Markov model to simulate exchange rate scenarios for counterparty risk. Eventually Boursicot et al analyzes CoCo bonds and find that they reduce the total cost of debt which is positive for shareholders. In a nutshell all the featured papers contribute to shedding light on various aspects of credit risk management that have so far largely remained unexplored.

The First Wave Loke Hoe Yeong, 2019-09-30 Based on extensive interviews and archival material *The First Wave* tells the story of the opposition in Singapore in its critical first thirty years. In Parliament Democratisation has been described to occur in waves. The first wave of a democratic awakening in post independence Singapore began with J B Jeyaretnam's victory in the Anson by election of 1981. That built up to the 1984 general election the first of many to be called a watershed in which Chiam See Tong was also elected in Potong Pasir. After their successes in 1991 the opposition began dreaming of forming the government. But their euphoria was short lived. Serious fault lines in the leading Singapore Democratic Party (SDP) rose to the surface almost immediately after the opposition victories of 1991 and the party was wiped out of Parliament by 1997. The opposition spent the next decade experimenting with coalition arrangements to work their way back to victory.
