Food Safety and Natural Toxins Mary Fletcher, Gabi Netzel, 2020-11-13 Natural toxins are poisonous secondary metabolites produced by living organisms which are typically not harmful to the organisms themselves but can impact on human or animal health when consumed Common sources of such toxins include poisonous plants fungi algae and bacteria and the diversity of these biological systems presents challenges to analytical chemists in identification in addition to wide ranging food safety implications when present as contaminants in food commodities The propensity for such toxins to be present in both animal feed and human food has led to the introduction of regulations for a small number of the most potent natural toxins particularly mycotoxins Implementation of these regulations necessitates the establishment of high throughput analytical chemistry methods with increasingly lower limits of detection The impacts of plant toxins are not limited to grazing livestock but can be carried through the food chain with some toxins such as indospicine being demonstrated to accumulate in tissues of grazing animals causing secondary poisoning in animals consuming meat from this livestock This Special Issue focuses on the analysis of natural toxins and their incidence from source organisms to food and feed commodities in addition

to their implications for food safety

Cross-Reactive Immunity and COVID-19 Alberto Beretta, Ahmed Yaqinuddin,Aristo

Vojdani, Pedro A. Reche,2025-01-06 There is a growing evidence that cross reactive immunity from common human coronaviruses hCoVs can shape the immunological response to SARS CoV 2 Cross reactive T cells appear to play a protective role against disease but there is no consensus on the role of cross reactive antibodies with some authors reporting protective effects mechanisms and other authors reporting evidence of negative interference due to the generation of low affinity antibodies in the context of an original antigenic sin Reports of association of pre existing immunity to hCoVs and milder clinical manifestations of COVID 19 conflict with other reports showing in COVID 19 patients a strong back boosting of antibodies to hCoVs with very little if no neutralizing activity against SARS CoV 2 However SARS CoV 2 hCoVs cross reactive antibodies more specifically those directed against the S2 subunit of the Spike protein may be protective via Fc mediated mechanisms that recruits NK cells ADCC or similar mechanisms Since these antibodies do not neutralize or neutralize very poorly SARS CoV 2 in vitro they have been only occasionally investigated and rarely considered in the search for correlates of protection Alternatively it should also be considered that protection against severe COVID 19 disease may be sustained by cross reactive T cells with cross reactive antibodies being only a proxy of protective T cell immunity Although pre existing immunity to SARS CoV 2 is more often linked hCoVs other sources of cross reactive immunity to SARS CoV 2 including bacteria and vaccine antigens are also plausible and should be considered In particular it has been identified first computationally and later experimentally cross reactive immunity to SARS CoV 2 from combination tetanus diptheria vaccines DTaP DTwP TD and Tdap Moreover epidemiological studies have clearly shown that subjects vaccinated with tetanus diptheria vaccines are less likely to suffer severe COVID 19 Cross reactive immunity to SARS CoV 2 from pediatric tetanus Diptheria vaccines and seasonal exposures to hCoVs likely play an important role in protecting children from COVID 19 On the other hand the elderly may fail to mount an effective primary response to SARS CoV 2 following infection owing to the loss of cross reactive memory B and T cells and their relative inability to recruit naive T and B cells *Catalog of*

Radiolabeled Monoclonal Antibodies for Imaging and Therapy Suresh C. Srivastava, 2013-03-14 The advent of hybridoma technology leading to the successful production of monoclonal antibodies against a variety of tumor associated antigens has during the last decade provided a very powerful tool for research and clinical investigations These highly specific reagents have essentially replaced the polysera of the earlier days The successful demonstration of the many wide ranging capabilities of the monoclonal antibody technique has already begun to exert an enormous impact on diverse areas of research in basic science and medicine In particular the potential of monoclonal antibodies to serve as carriers for selective targeting of radionuclides to tumors for diagnosis or therapy has stimulated an intense surge of research interest and even revived hopes of realizing Ehrlich's concept of the magic bullet Indeed the technology appears to be on the threshold of a revolution in diagnosing and treating malignant disease Much work remains to be done however and even though the progress has been impressive results to date have shown only moderate success There is no question that the limited success we have achieved thus far is merely a prelude to the many more exciting developments yet to come
