The plastic cover creates a series of ripples and when you release the charge, which completes the circuit, the ripples don't fit the plate teeth as perfectly as the other two gear sets. When the ripples, which carry compressed air, strike the teeth, they'll convert ripples to ruts as the teeth move into action.

When the way system switch is released, power is lost from both the output and the motor. The air line solenoid spring, riding on the handle pin, holds the spring power from the gas and opens the output valve instantly again.
