

LABORATORY

EXPERIMENT 1: THE EFFECT OF TEMPERATURE ON THE RATE OF A CHEMICAL REACTION

The purpose of this experiment is to determine the effect of temperature on the rate of a chemical reaction. The reaction studied is the reaction between hydrogen peroxide and potassium iodide. The rate of reaction is measured by the time taken for a certain amount of iodine to be produced. The experiment is carried out at different temperatures and the results are plotted on a graph of $\ln k$ against $1/T$. The slope of the line gives the activation energy of the reaction.

The reaction between hydrogen peroxide and potassium iodide is an exothermic reaction. The rate of reaction increases as the temperature increases. This is because the molecules have more energy and are able to overcome the activation energy more easily. The experiment is carried out at different temperatures and the results are plotted on a graph of $\ln k$ against $1/T$. The slope of the line gives the activation energy of the reaction.

The rate of reaction is measured by the time taken for a certain amount of iodine to be produced. The experiment is carried out at different temperatures and the results are plotted on a graph of $\ln k$ against $1/T$. The slope of the line gives the activation energy of the reaction.

The experiment is carried out at different temperatures and the results are plotted on a graph of $\ln k$ against $1/T$. The slope of the line gives the activation energy of the reaction.

The slope of the line gives the activation energy of the reaction.

The activation energy of the reaction is determined by the slope of the line.
