Quantitative Diagenesis: Recent Developments and Applications to Reservoir Geology A. Parker, B.W. Sellwood, 2012-12-06 Reservoirs generally consist of sandstones or carbonates exhibiting heterogeneities caused by a wide range of factors Some of these formed depositionally e g as channels palaeosols clay seams or salts others may be diagenetic in origin e g carbonate or silica cemented zones authigenic clays karstic surfaces The severity with which diagenesis affects rock systems results from the interplay between the diagenetic process itself and the timescale over which it operated The book provides a wide ranging overview of diagenetic processes and responses in calcareous argillaceous arenaceous and carbon rich microbial and organic sedimentary systems It introduces diagenetic concepts reviews existing knowledge and shows how existing qualitative approaches might be developed in more quantitative ways Several chapters consider mass balance calculations and the temporal and spatial aspects of diagenetic processes It is unique as a textbook in providing such a breadth of diagenetic subject range and such depth of coverage in each topic It provides a source reference for advanced students and professionals active in reservoir and aquifer studies *The Precambrian Earth* P.G.
