Stem Cell Research Great Britain. Parliament. House of Lords. Select Committee on Stem Cell Research, Great Britain. Parliament. House of Lords, 2002 The Committee was appointed in March 2001 to examine the issues arising from the Human Fertilisation and Embryology Research Purposes Regulations 2001 These regulations extended the legal grounds for research on human embryos to include the increase of knowledge about the development of embryos or serious disease or to enable such knowledge to help in the development of treatments for serious diseases The Committee's report analyses the potential of stem cell research to generate new therapies and assesses the relative scientific advantages and disadvantages of research on embryonic and adult stem cells It considers the ethical concerns about the use of early human embryos for research purposes and the implications of developments in cell nuclear replacement and reproductive cloning The report discusses the current regulatory regime and the scope for future legislation including the issue of informed consent and the creation of stem cell banks Overall the Committee finds that there is a strong scientific and medical case for continued research on human embryonic stem cells in order to realise the full therapeutic potential of stem cell research Adult stem cell research holds the promise of future therapies which might make further research on embryonic cells unnecessary although this is unlikely in the foreseeable future In the meantime to ensure maximum medical benefit it is necessary to keep both routes to therapy open since neither alone is likely to meet all therapeutic needs The role of the Human Fertilisation and Embryology Authority is crucial to the effective regulation of research and maintenance of public confidence The Ethics of Embryonic Stem Cell Research Katrien Devolder, 2015-01-22 Embryonic stem cell research holds unique promise for developing therapies for currently incurable diseases and conditions and for important biomedical research However the process through which embryonic stem cells are obtained involves the destruction of early human embryos Katrien Devolder focuses on the tension between the popular view that an embryo should never be deliberately harmed or destroyed and the view that embryonic stem cell research because of its enormous promise must go forward She provides an in depth ethical analysis of the major philosophical and political attempts to resolve this tension One such attempt involves the development of a middle ground position which accepts only types or aspects of embryonic stem cell research deemed compatible with the view that the embryo has a significant moral status An example is the position that it can be permissible to derive stem cells from embryos left over from in vitro fertilisation but not from embryos created for research Others have advocated a technical solution Several techniques have been proposed for deriving embryonic stem cells or their functional equivalents without harming embryos An example is the induced pluripotent stem cell technique Through highlighting inconsistencies in the arguments for these positions Devolder argues that the central tension in the embryonic stem cell debate remains unresolved This conclusion has important implications for the stem cell debate as well as for policies inspired by this debate Human Cloning and Embryonic Stem Cell Research After Seoul United States. sections It opens with an overview of the latest in stem cell research focusing on specific diseases and the treatment of burn victims Part II discusses the issues involved in the many steps from bench to bedside ranging from first research in vitro to clinical trials Part III covers scientific regulatory and ethical challenges to basic research and Part IV details issues regarding stem cell banks Part V explores ethical economic and strategic issues involved in collaboration between universities and industry and Part VI addresses legal problems raised by patents on human stem cell based inventions plus the extent to which there can be technological solutions to a moral dilemma Part VII presents imaginative ways of communicating research to the general public and how to create conditions for a constructive dialogue Part VIII probes psychosocial and cultural factors affecting judgment and decisions about translational stem cell research and Part IX explores problems and procedures raised by an examination of the evaluation of stem cell research projects in research ethics committees The book closes with a look into the future of translational stem cell research and stem cell based therapeutic applications **The**

analysis of the contentious relationship between the White House and the scientific community from the FDR administration to the Obama administration Toxic Mix A Handbook of Science and Politics takes a topic very much in the center of public debate in the last decade and places it in a revealing historical context It follows the often contentious relationship of science and politics from the FDR era to the current Obama administration highlighting the many highly charged moments when the two were in conflict Toxic Mix ranges across the major areas of scientific inquiry with public policy implications including atomic energy space science public health stem cells sexual reproduction environmental science global warming and evolution to examine important events where political imperatives and scientific research were at odds In addition the book looks at another important area where politics and science are at cross purposes immigration as many of our most

accomplished degree earners are foreign born and are unable to stay and work in the United States A final chapter analyzes the attempts by the early Obama administration to build public policy that embraces science rather than manipulates it

Biotechnology Policy across National Boundaries D. West, 2007-07-23 A globalization of innovation has produced the most massive spurt in biotechnology in world history Businesses universities and non governmental organizations are collaborating to produce a science industrial complex in biotechnology Using case studies of stem cell research cloning genetically modified food in vitro fertilization and chimeras in a number of Eastern and Western countries around the world I argue that much of this biotech activity is global in nature and independent of state control This shift in the relative influence of state and non state actors has led to the virtual deregulation of biotechnology and the liberation of innovation from geo political constraints These trends post a number of interesting social political and ethical issues for the contemporary period and suggest the need to rethink how controversial moral issues are handled by the science industrial complex
