Infinite Horizon Optimal Control Dean A. Carlson, Alain Haurie, 2013-06-29 This monograph deals with various classes of deterministic continuous time optimal control problems which are defined over unbounded time intervals For these problems the performance criterion is described by an improper integral and it is possible that when evaluated at a given admissible element this criterion is unbounded To cope with this divergence new optimality concepts referred to here as overtaking weakly overtaking agreeable plans etc have been proposed The motivation for studying these problems arises primarily from the economic and biological sciences where models of this nature arise quite naturally since no natural bound can be placed on the time horizon when one considers the evolution of the state of a given economy or species The responsibility for the introduction of this interesting class of problems rests with the economist who first studied them in the modeling of capital accumulation processes Perhaps the earliest of these was F Ramsey who in his seminal work on a theory of saving in 1928 considered a dynamic optimization model defined on an infinite time horizon Briefly this problem can be described as a Lagrange problem with unbounded time interval The advent of modern control theory particularly the formulation of the famous Maximum Principle of Pontryagin has had a considerable impact on the treatment of these models as well as optimization theory in general

Geophysical Inverse Theory Robert L. Parker, 1994-06-05 In many physical sciences the most natural description of a system is with a function of position or time In principle infinitely many numbers are needed to specify that function but in practice only finitely many measurements can be made Inverse theory concerns the mathematical techniques that enable researchers to use the available information to build a model of the unknown system or to determine its essential properties In Geophysical Inverse Theory Robert Parker provides a systematic development of inverse theory at the graduate and professional level that emphasizes a rigorous yet practical solution of inverse problems with examples from experimental observations in geomagnetism seismology gravity electromagnetic sounding and interpolation Although illustrated with examples from geophysics this book has broad implications for researchers in applied disciplines from materials science and engineering to astrophysics oceanography and meteorology Parker s approach is to avoid artificial statistical constructs and to emphasize instead the reasonable assumptions researchers must make to reduce the ambiguity that inevitably arises in complex problems The structure of the book follows a natural division in the subject into linear theory in which the measured quantities are linear functionals of the unknown models and nonlinear theory which covers all other systems but is not nearly so well understood The book covers model selection as well as techniques for drawing firm conclusions about the earth independent of any particular model

Linear Multivariable Systems W. A. Wolovich, 2012-12-06 This text was developed over a three year period of time 1971-1973 from a variety of notes and references used in the presentation of a senior first year graduate level course in the Division of Engineering at Brown University titled Linear System Theory The intent of the course was not only to introduce students to the more modern state space approach to multivariable control system analysis and design as opposed to the classical frequency domain approach but also to draw analogies between the two approaches whenever and wherever possible It is therefore felt that the material presented will have broader appeal to practicing engineers than a text devoted exclusively to the state space approach It was assumed that students taking the course had also taken as a prerequisite an undergraduate course in classical control theory and also were familiar with certain standard linear algebraic notions as well as the theory of ordinary differential equations although a substantial effort was expended to make the material as self contained as possible In particular Chapter 2 is employed to familiarize the reader with a good deal of the mathematical material employed through out the remainder of the text Chapters 3 through 5 were drawn in part from a number of contemporary state space and matrix algebraic references as well as some recent research of the author especially those portions which deal with polynomial matrices and the differential operator approach *Gradient Optimization and Nonlinear Control* Lawrence Hasdorff, 1976 **Applied Mechanics Reviews**, 1969 **Large-Scale Systems Control and Decision Making** H. Tamura, 1990-01-19 Six contributors from Japanese universities explore the basic theory and

methodology of control and decision making in systems that either contain many variables or have some special characteristics such as multiple subsystems or control stations a decentralized and or hierarchical information stru
