attention However threats arising from the loss and degradation of natural habitats have had no less effect on moths and have endangered many more species The status and fortunes of many moths are still unknown but a growing number of success stories such as that of the Black veined Moth point the way to better practice for the future and to the preservation of this enormous wealth of beauty diversity and natural history interest **The Beekeepers Field Guide** David

Introduction to the series. Archiearinae, Oenochrominae, Geometrinae Axel

Hausmann, 2021-10-25 The Lepidoptera are without doubt the best known insect order in today's Europe Nevertheless there is still a great lack of knowledge in some groups such as the Geometridae The northern and central European fauna is relatively well known but the distribution and bionomics of a number of species are poorly known This problem is much more marked in southern Europe where no books on Geometridae have been published for nearly a century Data on the bionomics are frequently unavailable which makes it difficult to assess environmental threats to the geometrid species Information on distribution is still grossly incomplete and many records have been based on misidentifications These problems are mainly caused by the lack of comprehensive identification literature The geographical area covered in this series ranges from North Cape to Gibraltar and Malta and from the Atlantic Ocean to the Ural Mountains Each volume will illustrate the adults of all species and if possible also subspecies in photographic colour plates of the highest quality Sexual dimorphism as well as polymorphism will be illustrated Most species will be shown at natural size but some larger groups of small species such as the genera *Idaea* and *Eupithecia* will be shown enlarged
