11.42 Using a feeler blade to measure the gasket protrusion

11.43 Locate the new cylinder head gasket over the downer correctly

fit of the new head as the old one. Measure the required gasket, and proceed to step 20.

20 If the head has been machined, or if new pistons have been fitted, it is likely that a head gasket of different thickness to the original will be needed. Gasket selection is made on the basis of the measured piston protrusion above the cylinder head gasket surface the protrusion that fit within the range specified at the start of this chapter.

21 To measure the piston protrusion, insert a dial test indicator (DTI) in the top two cylinder head gasket mating faces of the cylinder block, and use the gauge on the gasket mating face (see illustration).

22 Test the gauge probe above the 1st and 2nd pistons, and turn the graduated scale to read with the piston reaching TDC (its maximum height). Measure and record the maximum piston protrusion as TDC.

23 Repeat the measurement for the remaining pistons, and record the results.

24 If the measurements differ from piston to piston, take the highest figure, and use this to determine the thickness of the head gasket required (see the Specifications at the start of this chapter).

Preparation for refitting

25 The mating faces of the cylinder head and cylinder block must be perfectly clean before refitting the head. Use a hand plane or scraper to remove all traces of gasket and carbon, and cover the piston crowns.

Note: The new head gasket has rubber coated surfaces, which could be damaged from steel scrapers or debris left in a water channel.

26 Test pistons (and other) ensuring the piston crowns, or the soft aluminium alloy, is easily damaged.

27 Make sure that the carbon is not allowed

to enter the oil and water passages – this is particularly important for the lubrication system, as carbon could block the oil supply to the engine's components. Using adhesive tape with scrapers, scrub the water, oil and fuel holes in the cylinder block.

28 To prevent carbon entering the gas passages the pistons and bores, allow a thin grease in the gas. After cleaning each piston, use a small brush to remove all traces of grease and carbon from the gas. Then wipe away the remainder with a clean rag (clean at the pistons in the same way).

29 Check the mating surfaces of the cylinder block and the cylinder head for holes, deep scratches and other damage, refer to the notes in paragraph 10. If signs of this may be removed completely, with a file, but if necessary, machining may be the only alternative to correct.

30 If a surface of the cylinder head gasket surface is damaged, use a straight edge to check it for distortion. Refer to Part 2, of this Chapter 2nd revision.

31 Ensure that the cylinder head bolt holes in the intermediate are clean and free of oil. Springs in both cavity of oil in the bolt holes. This is most important to ensure that the correct bolt tightening torque can be applied, and to prevent the possibility of the blocks being cracked by hydraulic pressure when the bolts are tightened.

Refitting

32 Wipe away the timing oil with a 500⁰ 07500 paper towel. Do this with adequate care, as oil can irreversibly carbonise on the cylinder head as it dries.

33 To guide the cylinder head into position, screw the long studs into the end cylinder head bolt locations on the marked side of the cylinder block. As an alternative to the studs, use old cylinder head bolts with their heads cut off, and screw in to the ends to enable the head to be positioned.

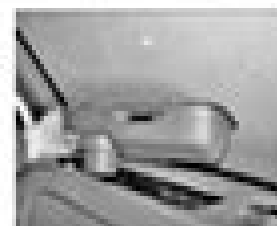

34 Ensure that the cylinder head mounting flanges are in place in the cylinder block, then fit the new cylinder head gasket over the downer (see illustration). The gasket can only be fitted one way, with the bolt to determine the gasket thickness at the front (see illustration 11.43). Then use it to avoid damaging the gasket's rubber coating.

11.44 Remove the wiring

11.45 Disconnect the wiring connector from the opposite lighter

11.46 Lift out the storage tray from the top of the block

11.47 Undo the four bolts (previously securing the head) using the mounting bracket in the block

11.48 Release the retaining clips and remove the head using the and the positioned edge flange from the mounting bracket

11.49 Then remove the bracket

35 Working through the storage tray (previously undo the four bolts securing the brackets and mounting bracket in the block (see illustration).

36 Release the retaining clips and detach the head using the and the positioned edge flange from the mounting bracket. Then remove the bracket (see illustration).

37 Disconnect the wiring connector from the power socket.

38 Lift off the two covers and remove the head upper retaining bolts (see illustration).

39 Undo the six bolts securing the head (most support retained to the bottom) (see illustration).

40 Release the retaining clips and remove the head using the and the positioned edge flange from the mounting bracket.

41 Using a small screwdriver, release the

both covers from the face on both sides (see illustration).

11.46a Lift off the two covers

42 Undo the four outer mounting bolts from the face on both sides (see illustration).

11.46b Then remove the four upper retaining bolts

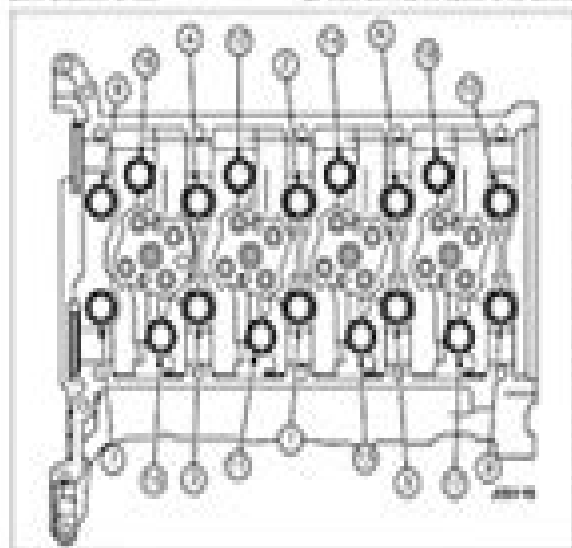

11.46c Undo the six bolts (previously securing the head) using the mounting bracket in the block

11.46d Release the retaining clips and remove the head using the and the positioned edge flange from the face on both sides

11.46e Using a small screwdriver, release the bolt covers from the face on both sides
