

Prepare the Endpin Hole for the Jack

There are two steps to enter the output hole to accept the pickup.

Step and Seal

If you have the time, this is the preferred method. Remove the endpin and widen the hole to size with a 1/32" (1.5 mm) reamer (available in the US & Canada through Stewart Macdonald, 800-848-0273 part #M325).

OR ...

Quick & Clean

The alternative form is to quickly drill out the endpin jack hole, with the endpin or other suitable plug in place. This may require a loose endpin and reamer fit in the endpin with superglue glue before entering the procedure.

NOTE: We do not recommend this method for instruments with brittle structural elements (as obtained around the endpin).

1. Apply masking tape around the endpin area to protect the instrument.

2. Locate an 1/8" (3.2mm) wide 1/32" (1.5mm) drill away from the body and end of the endpin.

3. Commence a guide hole in the center of the drilled endpin.

4. Drill a 1/32" (3.2mm) pilot hole through the endpin.

5. Line up a 1/32" (1.5mm) square bit in the pilot hole and begin cutting. Maintain a perpendicular plunge in relation to the instrument. Use steady but not heavy pressure, especially at the start only inside the guitar.

6. To avoid damage to the instrument, at the end come to a complete stop before removing it from the hole.

Solder the Wire Connections

1. Cleanse the soldering iron to ensure the greatest metal bond.

2. Strip 1/4" off the outside jacket of the pickup wire. For both the inner conductor and the ground wire.

3. Thread the pickup wire through the soldering cap.

4. Thread the pickup wire through the center where metal hole, then under the signal wire from the pickup that wires to the jack terminal "1" on the preamp circuit board. Solder the ground wire from the pickup (solder in the adjacent pad marked "G" on the preamp circuit board). (See Fig. 1) Do not use heat for solder joint (long or short) at the jack from the circuit board.

5. Repeat the soldering cap to the jack. Be careful not to allow the soldering cap to come in contact with the end of the circuit board.

6. Lead the soldering cap to the hot wire line not.

Figure 1

Optional Stereo Wiring

The Fishman Transducer™ switching endpin jack is integrated into the Transducer™. A variety of stereo wiring options are available for pickup-microphone or piezoelectric.

Two Pickups

Pickup & Electret Microphone

(use with the Fishman Transducer System)

NOTE: Before you insert a microphone, check the manufacturer's specific wiring instructions prior to using.

Additional Volume & Tone Controls

Fasten the Jack in the Endpin Hole

Follow the sequence when installing the endpin jack:

1. Preamp / Soldering Cap
2. 1st Large Hex Nut
3. 2nd Large Hex Nut
4. Large O-ring Washer
5. Oar Washer
6. Solder End Bush
7. Small O-ring Washer
8. Small O-ring Nut
9. Strap Buffer

The jack should protrude at least 1/16" (1.5 mm) up to no more than 1/32" (1.5 mm) outside the guitar's body for proper fit.

If the endpin does not enter the end of the jack, then insert a 1/32" (1.5 mm) drill through the end hole of the jack. Tighten the nut with a 1/2" open end wrench while holding the jack in place with the other wrench. Press and hand-tighten the strap buffer.

NOTE: With the strap buffer in place, the end of the jack should protrude slightly, so that when a plug is inserted, it will seat securely in place.

Attach the Battery Clip

We recommend that you attach the battery clip to a small piece of hardwood approximately 1 1/2" x 1 1/2" x 1/2" (3.8 x 3.8 x 1.3 cm) thick. Mark the screw hole locations on the back using the battery holder as a template. Drill the screw holes using the 3/32" (2.4mm) drill. Attach the battery holder using the two supplied 1/4" screws. Mount this assembly to the inside front block (most likely) using either wood glue or a glue filling superconductive such as Loctite Blue-Lox™.

Important! Although the supplied battery holder should provide adequate capacity to play the battery at all times, we strongly recommend that you remove the battery when shipping your instrument. FAILURE TO REMOVE BATTERIES COULD RESULT IN DAMAGE TO YOUR INSTRUMENT. Fishman will not be held responsible for any damage caused to instruments from a loose battery.

A set of adhesive backed strips has been provided to secure the pickup (also see battery note inside the guitar) once the endpin jack has been installed. Remove the plastic film from the back of each strip to ensure the adhesive. Secure the cable(s) to the back of the body of the guitar.

Troubleshooting

Symptom	Cause	Solution
Weak string or strings	Battery is not completely inserted	Insert the battery into the back of the guitar.
	Bottom of cavity is covered in dirt or debris with the wires	Clean bottom of cavity to eliminate dirt and moisture.
	Debris in the cavity wire	Remove debris from the cavity wire.
	Harmonic cavity is too tight or loose	Make sure that the cavity has a 1/16" (1.5 mm) gap.
	Cavity covered	Do not use tape, only a clear adhesive (available for the cavity material). We recommend the Transducer™ T-1 high performance tape.
	Not enough soldering pressure on cavity	Refill the cavity wire.
Hum	Covered or only up cavity wire	Strip the bottom of the cavity in comparison to depth difference in the cavity wire to lead the cavity wire.
	Wire hole too tight	The wire hole must be 1/16" (1.5 mm) diameter.
	Picking timing in cavity wire	The cavity wire must be 1/16" (1.5 mm) wide from the front and back to the back of the cavity. Run the wire to the correct width.
Thin or weak signal	Harmonic cavity is too tight, resulting in poor wire contact	Check cavity for wiring fit in the wire.
	Too pickup wires	Remove the pickup. Replace pickup in the harmonic in front.
	Incorrect jack	Replace the Soldering Cap to the jack.
Pickup intermittent or dead	Not soldering pressure but in the string (weak signal)	Refill the cavity wire. Refill the cavity wire if necessary.
	Harmonic cavity is too tight	Make a 1/16" (1.5 mm) gap.
	Picking timing in cavity wire	Width of cavity pickup cavity wire to the harmonic in front.
