*AC/DC Grids into Modern Power Systems* Fazel Mohammadi, 2020-12-10 Electric power transmission relies on AC and DC grids. The extensive integration of conventional and nonconventional energy sources and power converters into power grids has resulted in a demand for high voltage HV, extra high voltage EHV and ultra high voltage UHV AC DC transmission grids in modern power systems. To ensure the security, adequacy and reliable operation of power systems, the practical aspects of interconnecting HV EHV and UHV AC DC grids into the electric power systems along with their economic and environmental impacts should be considered. The stability analysis for the planning and operation of HV EHV and UHV AC DC grids in power systems is regarded as another key issue in modern power systems. Moreover, interactions between power converters and other power electronics devices e.g. FACTS devices installed on the network are other aspects of power systems that must be addressed. This Special Issue aims to investigate the integration of HV EHV and UHV AC DC grids into modern power systems by analyzing their control, operation, protection, dynamics, planning, reliability and security along with considering power quality improvement, market operations, power conversion, cybersecurity, supervisory and monitoring, diagnostics and prognostics systems.

Nothing tends so much to the advancement of knowledge as the application of a new instrument Sir Humphry Davy 1778 1829 Neuroscience has become a rapidly expanding endeavor that relies on a number of other sciences such as mathematics physics chemistry engineering computer science general biology and medicine genetics etc In fact many of its recent successes result from the application of ideas and methods borrowed from these fields Insofar it is a true interdisciplinary undertaking This convergence of influences accounts for part of its enormous attractiveness and fascination to students and researchers from diverse walks of life or science for that matter It is probably fair to say that a great number of neuroscience's most creative and productive proponents have been lured into this field not only by the excitement about the possibility to unmask the secrets of the human mind but also by the appeal of a vast unknown land needing cultivation and tools to cultivate it Danger may arise for any science if it is dominated by methods and techniques of investigation rather than by problems to be solved and concepts to be developed This might concentrate efforts onto the technically feasible and doable rather than on the real issues But on the other hand especially the young and growing sciences are heavily dependent on the development and application of methods often even before a problem relying on these methods may become apparent      *The Library Bulletin of Cornell University* ,1891      *Library Bulletin of Cornell University* Cornell University.
