### Basic Principles of the Cell

1. The diagram in the book for providing three types of function clearly shows which processes have been assigned to each compartment of a eukaryotic cell. Complete the table with the appropriate processes (10).

- 1. Nucleus: DNA replication and transcription
- 2. Mitochondrion: cellular respiration
- 3. Golgi apparatus: protein processing
- 4. Plasma membrane: transport
- 5. Cytoplasm: protein synthesis
- 6. Vacuole: storage

2. In what way does a nucleus depend on the cytoplasm for cellular work?

The nucleus is made of DNA which is the genetic material. It is surrounded by a nuclear envelope which is a double membrane. The nuclear envelope is perforated by nuclear pores which allow for the exchange of materials between the nucleus and the cytoplasm.

3. Explain the role of each phase of eukaryotic cell division.

In prokaryotes, cell division is binary fission. In eukaryotes, cell division is mitosis. Mitosis is a process by which a single cell divides into two daughter cells. The process is divided into four stages: prophase, metaphase, anaphase, and telophase. In prophase, the chromosomes condense and the nuclear envelope breaks down. In metaphase, the chromosomes align in the center of the cell. In anaphase, the sister chromatids separate and move to opposite poles of the cell. In telophase, the nuclear envelope reforms around the two sets of chromosomes.

4. Complete the following statements about your responses to the previous question.

- Prophase: chromosomes condense and nuclear envelope breaks down
- Metaphase: chromosomes align in the center of the cell
- Anaphase: sister chromatids separate and move to opposite poles
- Telophase: nuclear envelope reforms around the two sets of chromosomes
- Cytokinesis: the cell membrane pinches off to form two daughter cells

The nuclear envelope is made of two membranes. The outer membrane is continuous with the endoplasmic reticulum. The inner membrane is smooth. The nuclear envelope is perforated by nuclear pores. The nuclear pores are made of proteins and allow for the exchange of materials between the nucleus and the cytoplasm.
