Embedded Systems Design Based On Formal Models Of Computation:

Embedded Systems Design Based on Formal Models of Computation Ivan Radojevic, Zoran Salcic, 2011-06-15 Models of Computation for Heterogeneous Embedded Systems presents a model of computation for heterogeneous embedded systems called DFCharts. It targets heterogeneous systems by combining finite state machines (FSM) with synchronous dataflow graphs (SDFG). FSMs are connected in the same way as in Argos, a Statecharts variant with purely synchronous semantics using three operators: synchronous parallel refinement and hiding. The fourth operator called asynchronous parallel is introduced in DFCharts to connect FSMs with SDFGs. In the formal semantics of DFCharts, the operation of an SDFG is represented as an FSM. Using this representation, SDFGs are merged with FSMs so that the behaviour of a complete DFCharts specification can be expressed as a single flat FSM. This allows system properties to be verified globally. The practical application of DFCharts has been demonstrated by linking it to widely used system level languages: Java Esterel and SystemC. **Software**

The papers deal with a large range of topics in the following research areas: new frontiers in software architecture, software verification and testing, software development methods, application and technology transfer, security and safety, and design principles. **Formal Methods and Models for System Design** Rajesh Gupta, Paul Le

Guernic, Sandeep Kumar Shukla, Jean-Pierre Talpin, 2004-10-01 Perhaps nothing characterizes the inherent heterogeneity in embedded systems than the ability to choose between hardware and software implementations of a given system function. Indeed, most embedded systems at their core represent a careful division and design of hardware and software parts of the system. To do this task effectively, models and methods are necessary: functionality to capture application behavior needs and system implementation constraints. Formal modeling can be valuable in addressing these tasks. As with most engineering domains, co-design practice defines the state of the art; it seeks to add new capabilities in system conceptualization, model transformation, optimization, and implementation. These advances, particularly those related to synthesis and verification tasks, directly depend upon formal understanding of system behavior and performance measures. Current practice in system modeling relies upon exploiting high-level programming frameworks such as SystemC, Esterel, to capture design at increasingly higher levels of abstraction and attempts to reduce the system implementation task. While raising the abstraction levels for design and verification tasks to be really useful, these approaches must also provide for reuse/adaptation of the existing intellectual property (IP) blocks. 16th International Conference on Information Technology-New Generations (ITNG 2019) Shahram Latifi, 2019-05-22 This 16th International Conference on Information Technology New Generations (ITNG) continues an annual event focusing on state-of-the-art technologies pertaining to digital information and
