

C. Functioning of Mechanism.

a) On Discharge.

I. At the moment of Discharge (Fig. 3) bolt (8) is locked to barrel extension — one piece with barrel — by locking block (2), and under the reaction of the gas pressure, these three parts recoil together on body (20) about 5 mm (0.2"): the energy stored up in the recoiling parts throws hammer (10) into the full-cock notch.

At the end of this travel, tongue (a) of locking block (2) enters the rearward recess of lock frame (9), and under the pressure of mainspring (15) — compressed by cocking motion — claw of coupling (18) depresses locking block (2), thereby releasing bolt from barrel.

II. Further rearward motion of barrel is arrested when block (15) makes contact with frame (9): the released bolt continues its travel rearwards under the impulse of recoil. Extractor (7) seated in head of bolt withdraws the spent case from chamber, which is then ejected vertically by striking a projection on frame (9) reaching into the boltway.

III. During its recoil, the bolt compresses recoil spring (3), seated between the closed head of bolt and abutment (4) locking into barrel extension, progressively storing up the recoil energy until fully taken up: the recoil spring then drives bolt forward, catching the topmost cartridge in magazine, lifted by spring (22) and carrier (21) and inserting it into chamber.
