Smelser,John C. Schmidt,1998 Successful management of water in mountain streams by the USDA Forest Service requires that the link between resource development and channel change be documented and quantified The characteristics of that linkage are unclear in mountain streams and the adjustability of these streams to land use and hydrologic change has been argued in court One way to quantify the adjustability of a stream is to examine its geomorphic history An excellent source of historic geomorphic data are the records associated with stream gaging stations maintained by the U S Geological Survey This report describes what records are available how to organize the data on computer spreadsheets and discusses 6 techniques that quantify the spatial and temporal magnitude of historic channel adjustments The discharge measurements include physical measurements of the channel In particular USGS discharge measurements include physical measurements of the channel By analyzing these measurements collectively it is possible to quantify monthly annual and decadal scales of adjustment Once the history of channel adjustment is determined it can be compared to histories of climate change flow regulation and land use These comparisons may link the geomorphic adjustments to particular patterns events or activities Resource managers can use this knowledge to better assess the ramifications of resource development land use and restoration efforts on mountain stream systems **McGraw-Hill Concise Encyclopedia of Science & Technology** ,2005 The most widely used science reference of its kind More than 7 000 concise articles covering more than 90 disciplines of science and technology all in one volume **The United States Catalog** ,1921 The United States Catalog Supplement, January 1918-June 1921 Eleanor E.
