16.1: THERMOCHEMISTRY

- **Vocabulary**
 - **thermochemistry** — the branch of chemistry that is the study of the energy changes that accompany chemical reactions and changes of state
 - **calorimeter** — a device used to measure the energy as heat absorbed or released in a chemical or physical change
 - **temperature** — a measure of how hot (or cold) something is; specifically, a measure of the average kinetic energy of the particles in an object; the unit should be in kelvins
 - **joule** — the unit used to express energy; equivalent to the amount of work done by a force of 1 N acting through a distance of 1 m in the direction of the force; abbreviation, J
 - **heat** — energy is always transferred from higher-temperature objects to lower-temperature objects until thermal equilibrium is reached; the energy transferred between objects that are at different temperatures; the SI unit for this as well as all other forms of energy is joule, J
 - **specific heat** — the quantity of heat required to raise a unit mass of homogeneous material 1 K or 1°C in a specified way given constant pressure and volume
 - **enthalpy change** — the amount of energy released or absorbed as heat by a system during a process at constant pressure
 - **enthalpy of reaction** — the amount of energy released or absorbed as heat during a chemical reaction
 - **thermochemical equation** — an equation that includes the quantity of energy as heat released or absorbed during the reaction as written
- **Chapter Highlights**
 - Thermochemistry is the study of the changes in energy that accompany chemical reactions and physical changes.
 - A thermochemical equation is an equation that includes the quantity of energy released or absorbed as heat during the reaction as written.
 - A battery (battery acid) in a digital pH meter is an example of chemical energy being used in a chemistry lab.
 - An enthalpy change is the amount of energy absorbed as heat by a system in a process carried out at constant pressure.
 - The enthalpy of reaction is the enthalpy change that occurs during a chemical reaction.
 - The enthalpy change is negative for exothermic reactions and positive for endothermic reactions.
 - Compounds with highly negative enthalpies of formation tend to be stable; compounds with highly positive or only slightly negative enthalpies of formation tend to be unstable.
 - The standard molar enthalpy of formation is the enthalpy change that occurs when one mole of a compound is formed from its elements in their standard states at 25°C and 1 atm.
 - The enthalpy change that occurs in a combustion reaction is called the enthalpy of combustion.
 - Enthalpies of reaction can be calculated by using enthalpies of formation of reactants and products.
