Manipulation of Mammalian Development Ralph B.L. Gwatkin, 2013-11-11 Developmental biology has been transformed recently by discoveries in the fields of molecular biology cell biology and immunology New ways of manipulating mammalian development are uncovering control mechanisms and enabling us to apply them in solving practical problems in animal production and human health This book outlines some of these new manipulations and how they have contributed to the present state of developmental biology Chapter 1 describes gene transfer by micro injection of cloned recombinant DNA into zygotes Although the factors that affect transformation frequencies and integration sites are still unknown such techniques offer a number of exciting prospects Research models for human disease could be artificially created and desirable characteristics in agricultural animals could be hanced The theme of cell to cell transfer is continued in Chapters 2 and 3 Chapter 2 describes pronuclear transplantation by Sendai virus induced fusion of the karyoplast with the enucleated embryo Using this procedure it has been demonstrated that both male and female genomes are essential for

normal development although the reason for this is not yet understood Chapter 3 describes studies on the fusion of whole oocytes
