Perfect/Complete Scattering Experiments Hans Kleinpoppen, Bernd Lohmann, Alexei N. Grum-Grzhimailo, 2013-12-04 The main goal of this book is to elucidate what kind of experiment must be performed in order to determine the full set of independent parameters which can be extracted and calculated from theory where electrons photons atoms ions molecules or molecular ions may serve as the interacting constituents of matter The feasibility of such perfect and or complete experiments providing the complete quantum mechanical knowledge of the process is associated with the enormous potential of modern research techniques both in experiment and theory It is even difficult to overestimate the role of theory in setting of the complete experiment starting with the fact that an experiment can be complete only within a certain theoretical framework and ending with the direct prescription of what and in what conditions should be measured to make the experiment complete The language of the related theory is the language of quantum mechanical amplitudes and their relative phases This book captures the spirit of research in the direction of the complete experiment in atomic and molecular physics considering some of the basic quantum processes scattering Auger decay and photo ionization It includes a description of the experimental methods used to realize step by step the complete experiment up to the level of the amplitudes and phases The corresponding arsenal includes beyond determining the total cross section the observation of angle and spin resolved quantities photon polarization and correlation parameters measurements applying coincidence techniques preparing initially polarized targets and even more sophisticated methods The complete experiment is until today hardly to perform Therefore much attention is paid to the results of state of the art experiments providing detailed information on the process and their comparison to the related theoretical approaches just to mention relativistic multi configurational Dirac Fock convergent close coupling Breit Pauli R matrix or relativistic distorted wave approaches as well as Green's operator methods This book has been written in honor of Herbert Walther and his major contribution to the field but even to stimulate advanced Bachelor

and Master students by demonstrating that obviously nowadays atomic and molecular scattering physics yields and gives a much exciting appreciation for further advancing the field

Electronic Expectations Tony Stankus, 2019-12-06 This book first published in 1999 analyses the

convergence of financial technical and public policy considerations that turned what seemed like science fiction twenty years ago into a library fact of life today It shows that while electronic publication greatly speeds issuance of important scientific results of enduring value it also has the potential to lower the economic threshold at which crank papers and marginal publications can gain a wide if sadly misled audience in the short run It demonstrates that while scientists invented the web they no longer control it and that even the very largest research organizations libraries publishers and journal aggregators will to a substantial degree be at the technological and economic mercy of commercial users of the web
