

As mentioned earlier, Philips engineers designed the DRI so that a step of one will change the volume CTDI by 12% and noise by 6% if other settings are unchanged.⁸ This structured way to adjust and review CTDI and estimated noise levels can be easily combined with iterative reconstruction technique settings to further optimize image quality. After the appropriate number of cycles and consideration of the results, adjustments to the DRI and iterative reconstruction technique settings can then be incorporated into the Exam Card to manage individual patient examinations.

Additional patient-specific approaches with iPatient

CTA exams: DRI and tube potential

For examinations with iodinated contrast media, a decrease in tube potential⁹ leads to an increase in iodine attenuation and signal. The decrease in tube potential (with tube current held constant) decreases $CTDI_{vol}$ and, therefore, increases noise in a highly non-linear fashion. iPatient provides a more intuitive approach: if the planned tube potential (kVp) is modified for a particular DRI setting, the average tube current (mAs) suggested by DoseRight CS automatically updates to maintain the same $CTDI_{vol}$. Then, the DRI can be used for more intuitive steps of 6% and 12 % in planned image noise and dose, respectively.

Radiation dose metrics are also changing from “one-size-fits all” approaches to more individualized metrics. The size-specific dose estimate,[6] for instance, provides a correction for CTDI based on a measure of effective diameter. This is a step toward patient-specific dose estimates such as organ dose estimation.

A 16 cm cylindrical phantom with five iodine samples (four peripheral, one central) was used to demonstrate this innovative approach (Figure 8). iCT data was acquired using DRI 28, 120 kVp, and 83 mAs ($CTDI_{vol} = 10.3$ mGy) and standard reconstruction (left). The tube potential was decreased to 100 kVp and the tube current automatically adjusted to 250 mAs to maintain the CTDI. The DRI was then incrementally decreased from 28 to 18 (88 mAs and $CTDI_{vol} = 3.5$ mGy) and iDose⁴ was used with a setting of 6. This resulted in a CNR increase of 45% and increased conspicuity of the center iodine sample (blue arrow).

Figure 8 A 16 cm phantom with five iodine samples was used to show how the DRI can simplify adjustments in the tube potential, mAs, and iDose⁴. These adjustments lead to an increase in the CNR at low dose.

Cardiac examinations and DoseRight CS

Low doses have been achieved while maintaining image quality with the use of prospective Step & Shoot and ECG triggered dose modulation for retrospective gated helical scans.[8][9] The iPatient enhancements are fully integrated with these high temporal resolution scan modes of the iCT and Ingenuity CT. As with non-gated scanning modes, DoseRight CS can be used to suggest the average tube current according to patient size and the DRI setting. This applies to Calcium scoring, prospectively-gated Step & Shoot examinations, and retrospective-gated cardiac exams.

⁸ Decreasing DRI by 3 from 15 to 12, for example, would decrease the average mAs by a factor of $(1.0 - 0.12)^3 = (0.88)^3 = 0.68$ or $(1 - 0.68) \times 100\% = 32\%$ and would increase noise by a factor of $(1.06)^3 = (1.06)^3 = 1.19$ or 19%.

⁹ Many patient-specific factors are considered when adjusting tube potential.
