Human Body Organs

Kidneys

Kidneys are the body's natural filters. They regulate the balance of fluids and waste in the body. They are located in the back of the body, one on each side of the spine. They filter out waste from the blood and return the clean blood to the body. They also help to regulate blood pressure and produce hormones that control the body's metabolism.

Stomach

Stomach is a muscular organ that is part of the digestive system. It is located in the upper abdomen. It receives food from the mouth and breaks it down into smaller pieces. It then sends the food to the small intestine for further digestion. The stomach also produces stomach acid, which helps to break down food.

Small Intestine

Small intestine is a long, coiled tube that is part of the digestive system. It is located in the lower abdomen. It receives food from the stomach and breaks it down into even smaller pieces. It then sends the food to the large intestine for further digestion. The small intestine also produces enzymes that help to break down food.

Large Intestine

Large intestine is a long, coiled tube that is part of the digestive system. It is located in the lower abdomen. It receives food from the small intestine and breaks it down into even smaller pieces. It then sends the food to the rectum for further digestion. The large intestine also produces enzymes that help to break down food.

Heart

Head of the body, the heart is a muscular organ that pumps blood throughout the body. It is located in the chest, between the lungs. It has four chambers: two atria and two ventricles. The atria receive blood from the body and the lungs, and the ventricles pump the blood out to the body and the lungs. The heart is the central organ of the circulatory system.

Liver

Liver is a large, reddish-brown organ that is located in the upper right abdomen. It is the largest internal organ in the body. It has many functions, including filtering toxins from the blood, producing bile, and storing energy. It also plays a role in the production of blood and the regulation of blood sugar.

Lungs

Lungs are two large, spongy organs that are located in the chest. They are the primary organs of the respiratory system. They take in oxygen from the air and send it to the rest of the body. They also remove carbon dioxide from the body and send it out through the nose and mouth. The lungs are essential for life.

Brain

Brain is the central organ of the nervous system. It is located in the head, protected by the skull and the meninges. It is the control center of the body, responsible for all of the body's functions. It receives information from the senses and sends out instructions to the muscles and organs. The brain is the most complex organ in the body.
