Akina Hoshino,Iris Lindberg,2012-01-12 The prohormone convertases PC 1 3 and 2 are calcium activated eukaryotic subtilisins with low pH optima which accomplish the limited proteolysis of peptide hormone precursors within neurons and endocrine cells In this lecture we review the biochemistry regulation and roles of PC1 3 and 2 in disease with an emphasis on the work published in the last 10 years In the 20 years since their discovery a great deal has been learned about their localization and cellular functions Both PCs share the same four domains the propeptides perform important roles in controlling activation and targeting the catalytic domains confer specificity with PC1 3 possessing a more restricted binding pocket than that of PC2 the P domain is required for expression and contributes to enzymatic properties and the C terminal tail assists in proper routing to granules PC1 3 but not PC2 exists in full length and C terminally truncated forms that exhibit different biochemical properties Both enzymes associate with binding proteins proSAAS is thought to modulate precursor cleavage by PC1 3 while co expression of 7B2 is obligatory for the formation of active PC2 Finally new studies have revealed an increasingly important role for PC1 3 polymorphisms and mutations in glucose homeostasis and obesity Table of Contents

Crops as a Sustainable Source of Food and Feed for the Future Antonio M. De Ron,Francesca Sparvoli,José J. Pueyo,Didier Bazile,2017-05-03 Grain legumes together with quinoa and amaranth pseudocereals and other crops are attractive candidates to satisfy the growing demand for plant protein production worldwide for food and feed Despite their high value many protein crops have not been adequately assessed and numerous species are underutilized Special attention has to be

paid to genetic diversity and landraces and to the key limiting factors affecting yield including water deficiency and other abiotic and biotic stresses in order to obtain stable reliable and sustainable crop production through the introduction and local adaptation of genetically improved varieties Legumes the main protein crops worldwide contribute to the sustainable improvement of the environment due to their ability to fix nitrogen and their beneficial effects on the soil They play a key role in the crop diversification and sustainable intensification of agriculture particularly in light of new and urgent challenges such as climate change and food security In addition the role of legumes in nutrition has been recognized as a relevant source of plant protein together with other benefits for health Chapters dealing with common bean lupine soybean lentil cowpea and Medicago are included in this book Most contributions deal with legumes but the significant number of papers on different aspects of quinoa gives an idea of the increasing importance of this protein crop Pseudocereals such as quinoa and amaranth are good sources of proteins Quinoa and amaranth seeds contain lysine an essential amino acid that is limited in other grains Nutritional evaluations of quinoa indicate that it constitutes a source of complete protein with a good balance among all of the amino acids needed for human diet and also important minerals vitamins high quality oils and flavonoids Other protein crops also included in this book are hemp cotton and cereals maize wheat and rice Although cereals protein content is not high their seeds are largely used for human consumption In this book are included articles dealing with all different aspects of protein crops including nutritional value breeding genetic diversity biotic and abiotic stress cropping systems or omics which may be considered crucial to help provide the plant proteins of the future Overall the participation of 169 authors in 29 chapters in this book indicates an active scientific community in the field which appears to be an encouraging reflect of the global awareness of the need for sustainability and the promising future of proteins crops as a source of food and feed

Heazlewood,Jesús V. Jorrín-Novó,Ganesh Kumar Agrawal,Silvia Mazzuca,Sabine Lühthje,2017-02-08 The field of proteomics has advanced considerably over the past two decades The ability to delve deeper into an organism s proteome identify an array of post translational modifications and profile differentially abundant proteins has greatly expanded the utilization of proteomics Improvements to instrumentation in conjunction with the development of these reproducible workflows have driven the adoption and application of this technology by a wider research community However the full potential of proteomics is far from being fully exploited in plant biology and its translational application needs to be further developed In 2011 a group of plant proteomic researchers established the International Plant Proteomics Organization INPPO to advance the utilization of this technology in plants as well as to create a way for plant proteomics researchers to interact collaborate and exchange ideas The INPPO conducted its inaugural world congress in mid 2014 at the University of Hamburg Germany
