Single-Shot 3D Sensing Close to Physical Limits and Information Limits Florian Willomitzer, 2019-07-05 This thesis discusses the physical and information theoretical limits of optical 3D metrology and based on these principal considerations introduces a novel single shot 3D video camera that works close to these limits There are serious obstacles for a perfect 3D camera The author explains that it is impossible to achieve a data density better than one third of the available video pixels Available single shot 3D cameras yet display much lower data density because there is one more obstacle The object surface must be encoded in a non ambiguous way commonly by projecting sophisticated patterns However encoding devours space bandwidth and reduces the output data density The dissertation explains how this profound dilemma of 3D metrology can be solved exploiting just two synchronized video cameras and a static projection pattern The introduced single shot 3D video camera designed for macroscopic live scenes displays an unprecedented quality and density of the 3D point cloud The lateral resolution and depth precision are limited only by physics Like a hologram each movie frame encompasses the full 3D information about the object surface and the observation perspective can be varied while watching the 3D movie **3D Videocommunication**

TVs become the next big thing in our living rooms? Anita Theis, 2013-06-01 This in depth research study discusses whether 3D TV will become a new trend in the consumers living rooms or if it is just a hype that will fail to establish itself. The study contains both extensive market research as well as target group research among the American population. Both parts of the study deal with the market situation of 3D TVs within the United States in 2011 and an extensive analysis of both studies provides in depth insight into a potential future of the 3D TV market in the coming years. In 2010 only 3% of US households had purchased a 3D TV. According to E Rogers book Diffusion of Innovation whose theory is used as a guideline throughout the whole research paper those 3% can be identified as belonging to the category of innovators. To incorporate other categories of the adopter categorization the 3D TV technology has to face economic sociological and technological challenges. Those challenges as well as the trends and developments influence the adoption of the technology. E Rogers discusses these influencing characteristics in his work and groups them into five categories: relative advantage, compatibility, complexity, observability and trialability. Based on Rogers book this study determines in how far those characteristics favor or disfavor the adoption process of 3D TV and how current trends and developments within the 3D TV sector might improve this process. These conclusions are then used in a target group research in order to determine whether they are feasible and will lead to a higher adoption rate of the technology within the next 3 to 5 years. Consequently this research paper can act as a guide for both TV manufacturers and TV content producers that invest or plan to invest into 3D TV. However the main purpose of the study is to be the starting point for marketing managers of those companies that already have started investing in 3D technology. The research gives insight into how the adoption process can be improved and it can therefore be used as a foundation for a successful marketing plan.

3D Displays Ernst Lueder, 2012-01-30 This book addresses electrical engineers, physicists, designers of flat panel displays (FPDs), students and also scientists from other disciplines interested in understanding the various 3D technologies. A timely guide is provided to the present status of development in 3D display technologies ready to be commercialized as well as to future technologies. Having presented the physiology of 3D perception the book progresses to a detailed discussion of the five 3D technologies: stereoscopic and autostereoscopic displays, integral imaging, holography and volumetric displays and introduces spatial and temporal multiplex for the two views needed for stereoscopic and autostereoscopic displays. Outlines dominant components such as retarders for stereoscopic displays and fixed as well as adjustable lenticular lenses and parallax barriers for auto stereoscopic displays. Examines the high speed required for 240 Hz frames provided by parallel addressing and the recently proposed interleaved image processing. Explains integral imaging, a true 3D system based on the known lenticulars which is explored up to the level of a 3D video projector using real and virtual images. Renders holographic 3D easier to understand by using phasors known from electrical engineering and optics leading up to digital computer generated holograms. Shows volumetric displays to be limited by the number of stacked FPDs and presents algorithms stemming from computer science to assess 3D image quality and to allow

for bandwidth saving transmission of 3D TV signals The Society for Information Display SID is an international society which has the aim of encouraging the development of all aspects of the field of information display Complementary to the aims of the society the Wiley SID series is intended to explain the latest developments in information display technology at a professional level The broad scope of the series addresses all facets of information displays from technical aspects through systems and prototypes to standards and ergonomics
