Garber, Chase R. Buchanan, 2009 In 2004 a total of 95 020 vehicle crashes occurred on highways under the jurisdiction of the Virginia Department of Transportation VDOT Of these 39 847 crashes occurred on primary highways and 345 of these were fatal crashes VDOT s traffic engineers continue to place increasing emphasis on identifying causal factors for crashes to enhance the selection of appropriate and effective countermeasures The purpose of this study was to identify causal factors and appropriate countermeasures for crashes occurring at high risk locations on multilane primary highways from 2001 through 2006 These high risk locations were identified by Fontaine and Reed 2006 in a VDOT safety corridor study A total of 365 sites 1 to 2 mi in length were used in the study The statewide sites were located on rural and urban highways with divided undivided and traversable medians with about 40 sites per VDOT district Crash data were extracted from police crash reports and geometric data were collected through site visits Operational data were collected using VDOT s resources The analysis involved more than 34 000 crashes and was conducted using fault tree analysis and generalized linear modeling The fault tree analysis was used to determine the critical fault path based on the probability of an event occurring Individual fault trees were constructed for each collision type and for each highway classification The generalized linear models were developed for different highway classifications urban divided urban undivided urban traversable central lanes that can be used for left turns in both directions and rural divided highways Models were developed for rear end crashes and

total crashes and separate models were developed for injury crashes property damage only PDO crashes and injury PDO crashes Appropriate potential countermeasures were then identified based on the significant causal factors identified in the models The results indicated that rear end crashes were the predominant type of crash representing 56% of all PDO crashes on urban divided highways and 37% of all PDO crashes on rural divided highways Implementing the recommended countermeasures for total rear end and angle crashes for different assumed levels of rehabilitation is expected to result in a crash reduction of up to about 40% depending on the site and level of rehabilitation undertaken A benefit cost analysis showed that the benefit cost ratios were higher than 1 for all levels of countermeasure implementation

Virtual Crowds Nuria Palechano, Norman Badler, Jan Allbeck, 2022-05-31 There are many applications of computer animation and simulation where it is necessary to model virtual crowds of autonomous agents Some of these applications include site planning education entertainment training and human factors analysis for building evacuation Other applications include simulations of scenarios where masses of people gather flow and disperse such as transportation centers sporting events and concerts Most crowd simulations include only basic locomotive behaviors possibly coupled with a few stochastic actions Our goal in this survey is to establish a baseline of techniques and requirements for simulating large scale virtual human populations Sometimes these populations might be mutually engaged in a common activity such as evacuation from a building or area other times they may be going about their
