Index-catalogue of the Library of the Surgeon General's Office, National Library of Medicine: Subjects A-M National Library of Medicine (U.S.), 1961 [Global Contamination Trends of Persistent Organic Chemicals](#) Bommanna G. Loganathan, Paul Kwan-Sing Lam, 2011-08-09 Environmental pollution by man made persistent organic chemicals (POCs) has been a serious global issue for over half a century. POCs are prevalent in air, water, soil, and organisms including wildlife and humans throughout the world. They do not degrade and cause long term effects in organisms. Exposure to certain POCs may result in serious environmental and health effects including birth defects, diminished intelligence, and certain types of cancers. Therefore POCs have been the subject of an intensive regional, national, and international effort to limit their production, use, and disposal of these chemical stocks. Trend monitoring studies are essential to make clear the behavior and fate of these compounds and to protect our environment and living resources. *Global Contamination Trends of Persistent Organic Chemicals* provides comprehensive coverage of spatial and temporal trends of classical and emerging contaminants in aquatic, terrestrial, and marine ecosystems including the Arctic and Antarctic ecosystems. Compiled by an international group of experts, this volume covers spatial and temporal trends of polychlorinated biphenyls (PCBs), chlorinated pesticides, polychlorinated naphthalenes (PCNs), polychlorinated dibenzo-p-dioxins, furans, PCDDs, DFs, polybrominated diphenyl ethers (PBDEs), hexabromocyclododecanes (HBCDs), perfluorinated compounds (PFCs), synthetic musks, polynuclear aromatic hydrocarbons (PAHs), and octyl and nonylphenols. Environmental and biological matrices used for the trend studies were atmosphere, water, soil, sediment, bivalve mollusks, fish, marine mammals, terrestrial mammals, and human breast milk. Spatial

and temporal trend studies presented from Australia Brazil China Estonia Ghana Hong Kong India Italy Japan Korea Norway Poland Sweden the United States coastal and open ocean environments and the Arctic and Antarctic regions POCs have been the subject of an intensive regional national and international effort to limit their production and use and to mitigate the disposal of these chemicals Since POCs are prevalent in air water soil and tissues of organisms including wildlife and humans throughout the world and do not degrade they cause long term effects in organisms Trend monitoring studies are essential to make clear the behavior and fate of these compounds and to protect our environment and living resources Relevant to professionals and students alike Global Contamination Trends of Persistent Organic Chemicals facilitates the understanding of environmental and biological behavior of these chemicals and the development of strategies for protecting the global environment for future generations
