Making Squid Server from Scratch: The Dummies Manual

Most of us should have heard of **Squid**, mostly while discussing requirements of **restricting Internet Usages** among clients. Although a requirement for **Squid** may arise for any few of the following reasons or anything else:

- 1- **To limit bandwidth usages:** Squid optimizes data flow between client and server to improve performance and caches frequently-used content to save bandwidth (*As data is being accessed locally not through ISP for further requests*).

Moreover, Organizations might have limited bandwidth or expensive over some threshold value, so management cannot permit employees to download inappropriate material as it usages precious bandwidth (*there are even options to limit the download size through Squid Server, which might be handy for such a scenario*).

- 2- **Due to Organizational Policy:** Sometimes, organizations might have very strict internet policies regarding offensive materials. For this and for other reasons like controlling distractions, they don't want their employees gaining access to inappropriate sites.
- 3- **To limit usages as per defined hours:** Sometimes, organizations might need to provide internet access to employees during certain working days / hours only.
- 4- **Monitoring site access patterns:** Sometimes, in place of restricting or in addition of restricting internet access, the purpose might be monitoring the usages patterns for further steps to optimize or restrict.

Most special point about **Squid** is its being open source and vast availability of information and tweaks through forums and blogs. That's why it's most preferable solution for any such scenario.

Here I am providing the **Step By Step Dummies Manual** for implementing a **Squid Proxy Server** for layman like me, which should be sure helpful for many of us (including myself).

Step-by-Step with the implementation:

- 1- **Base Machine:** For my deployment, I chosen CentOS as the Linux installation due to availability and reliability of update sources for the OS itself (*its replica OS to Redhat Enterprise versions with almost all features*). The Configuration for the machine was 2.66 GHz Core 2 Duo Processor, 1 GB RAM and 160 GB HDD space.

Installation was customized to have 2 GB swap partition, 200 MB boot partition, **Squid** package checked, **Web Server** packages checked, **SendMail** related packages (*Squid may be configured to send reports on mail*), **MySQL / PHP** packages checked (*not required for Squid itself, but might be required for reporting software's later on*).
