Fourier Analysis on Number Fields Dinakar Ramakrishnan, Robert J. Valenza, 2013-04-17 This book grew out of notes from several courses that the first author has taught over the past nine years at the California Institute of Technology and earlier at the Johns Hopkins University Cornell University the University of Chicago and the University of Crete Our general aim is to provide a modern approach to number theory through a blending of complementary algebraic and analytic perspectives emphasizing harmonic analysis on topological groups Our more particular goal is to cover Jolm Tate's visionary thesis giving virtually all of the necessary analytic details and topological preliminaries technical prerequisites that are often foreign to the typical more algebraically inclined number theorist Most of the existing treatments of Tate's thesis including Tate's own range from terse to cryptic our intent is to be more leisurely more comprehensive and more comprehensible To this end we have assembled material that has admittedly been treated elsewhere but not in a single volume with so much detail and not with our particular focus We address our text to students who have taken a year of graduate level courses in algebra analysis and topology While our choice of objects and methods is naturally guided by the specific mathematical goals of the text our approach is by no means narrow In fact the subject matter at hand is germane not only to budding number theorists but also to students of harmonic analysis or the representation theory of Lie groups

Set Theoretical Aspects of Real Analysis Alexander B. Kharazishvili, 2014-08-26 *Set Theoretical Aspects of Real Analysis* is built around a number of questions in real analysis and classical measure theory which are of a set theoretic flavor Accessible to

graduate students and researchers the beginning of the book presents introductory topics on real analysis and Lebesgue measure theory These topics highlight the boundary between fundamental concepts of measurability and nonmeasurability for point sets and functions The remainder of the book deals with more specialized material on set theoretical real analysis The book focuses on certain logical and set theoretical aspects of real analysis It is expected that the first eleven chapters can be used in a course on Lebesgue measure theory that highlights the fundamental concepts of measurability and non measurability for point sets and functions Provided in the book are problems of varying difficulty that range from simple observations to advanced results Relatively difficult exercises are marked by asterisks and hints are included with additional explanation Five appendices are included to supply additional background information that can be read alongside before or after the chapters Dealing with classical concepts the book highlights material not often found in analysis courses It lays out in a logical systematic manner the foundations of set theory providing a readable treatment accessible to graduate students and researchers
