Electrical elementary wiring diagram (elewd) user's manual L. P. Caissie,1997 The objective of this study is to
evaluate the relative impact of the design parameters on bundle uranium mass and sheath strain and to re evaluate the basis
for the limitation on bundle mass due to an increase in bundle subchannel cross sections bundle uranium mass is determined
by parameters that in turn affect the sheath strain during operation this might affect sub channel flow areas and affect the
chf ccp the bundle uranium mass was assessed with electres and resulting sheath strains estimated for a candu 6 fuel
channel operating at overpowers just at the trip set point of the reactor onset of sheath dryout a 14% power increase the
electres fuel modeling code is used to determine the relative impact on sheath strain of the design parameters that control
uranium mass namely pellet density diametral clearance axial gap and pellet face geometry chamfer dish depth and land
width a limitation was placed on bundle uranium mass by new brunswick power this came from a ccp evaluation showing
that a candu 6 reactor fuelled with bundles having average masses greater than 19 25 kg u would have a net positive sheath
strain over a fuel channel at the power for the onset of dryout and therefore a ccp penalty the calculations were based on
steady bundle powers operating in a fuel channel at ccp to a burnup of 168 mw middle dot h kg u at this burnup the strain
calculation included a 14% power boost these are indeed very conservative assumptions with a view to maximizing calculated
sheath strains without regard for fuel defect probability for comparison this study has produced electres strain calculations
for high power channel power histories representative of 8 bundle shifts also with a 14% power boost operating at dryout
