Introduction To Logistics By Wisener 3 Edition:

Total Cost Analysis in Logistics Björn Oskarsson, 2019-11-01 Cost is considered a crucial factor in much decision making in private and public organisations. Therefore the ability to calculate total estimated costs for different alternatives is important. However, such total cost analysis is a challenging task. Providing students with the knowledge and skills needed for total cost analysis is therefore relevant in several disciplines within higher education. Within logistics management, total cost analysis is for decades by several scholars regarded as a cornerstone, a fundamental part of the discipline. However, except for describing the basic steps and presumptions, the literature does not give much support concerning how to conduct such analyses or which the difficulties associated with total cost analysis are. This blank space in literature is not limited to the logistics discipline; it stretches throughout many disciplines. Neither does literature cover how to teach to support students' learning of total cost analysis. Hence, to address the lack of research, the purpose of this thesis was formulated as follows: To contribute to the understanding of conducting learning and teaching total cost analysis. Three research questions were shaped to address each part of the purpose: conducting learning and teaching (RQ1), What challenges are connected to the process of conducting total cost analysis? (RQ2), What thresholds are there for learning how to conduct total cost analysis? (RQ3), How can total cost learning be supported by suitable educational methods? The research questions are connected to each other in the sense that the challenges of conducting total cost analysis (RQ1) indicate within which areas total cost learning is difficult and thereby where thresholds are to be investigated (RQ2). Further knowledge about the learning thresholds is needed to discuss suitable educational activities (RQ3). The research was conducted by a combination of literature reviews and multiple case studies at four Higher Education Institutions where both teachers and students were approached. The findings for RQ1 were developed in an abductive procedure, walking back and forth between literature and cases. A twelve-step process for total cost analysis was defined, and specific challenges associated with each of these steps were identified. Regarding learning thresholds (RQ2), perceived difficulties with learning total cost analysis were identified in the case studies. These difficulties were then analysed against threshold characteristics available in literature. This resulted in the identification of four total cost learning thresholds. Literature on constructivist-based teaching was used to suggest teaching methods to support learning (RQ3). These types of activities proved to match the ones most appreciated by teachers and students in the studied cases. The twelve-step process provides a more structured and holistic view of total cost analysis than previously available in the logistics literature. The description of challenges with conducting total cost analysis is novel, not only within logistics but also generally, why this is a major contribution from this research. Aspects regarding teaching and learning connected to logistics and to total cost analysis are very sparsely addressed in literature, which makes the findings concerning learning thresholds and teaching methods valuable. The findings are believed to be useful for different stakeholders. First and foremost, teachers can use the findings for designing programs, courses, and course modules which cover the important aspects of total

cost analysis with help from educational activities supporting the students learning Second for organisations where total cost analyses are conducted the suggested process with its steps and associated challenges can be used to achieve better total cost analyses and in turn more substantiated decisions In the longer perspective better education on total cost analysis at Higher Education Institutions will further strengthen the total cost competence in organisations thereby improving the total cost related decision making Total cost analysis is not unique for the logistics discipline Although focus in the study has been on Higher Education Institutions providing logistics courses the findings are to a high extent believed to be relevant also for other disciplines dealing with total cost analysis **Handbook of Military Industrial Engineering** Adedeji B.

ERP and Supply Chain Management Christian Ndubisi Madu, Chu-hua Kuei, 2005-06-10 Businesses today are faced with avalanche of information There is need to effectively manage information to serve customers better In today s highly competitive environment businesses need to be able to organize and coordinate their information so that a single view of information is maintained by all the service channels Information management can help to understand customers wants and needs and integrate such in product design It helps to manage inventory and reduces both cost and the cycle time to introduce new products to the marketplace Time to market is a critical issue in achieving competitiveness and without the availability of timely and accurate information it will not be possible to respond proactively to the changing market environment This book is about ERP and Supply Chain Management ERP is the short form for Enterprise Resource Planning The aim of ERP is to integrate the functions of the different business units and departments such as finance operations accounting and human resources This integration is necessary to organize and coordinate information that may be scattered in different departments and making them available in an organized format to the different decision centers where they may be needed Through this integrative approach the different functional units of the business are able to share a common database exchange information and have consistent view of their operations This consistent view is also presented to the customer thus improving the quality of customer service With the integration of the information system the different functional departments work together to achieve common organizational goals and objectives Without such integration common customer services such as order processing would be difficult to track and inconsistent information may be relayed by the different departments to the customer Supply chain management is an integral aspect of ERP Businesses today focus on their core competence It is no longer technically and economically feasible to focus on all activities Rather certain activities may be shifted to partners or vendors that have core competence in such areas Mercedes Benz may find it better to subcontract its radios to Bose while focusing on its car designing Yet these two companies may need to share key information on customers wants and needs as well as information on product designs Integrating a supplier into the common database helps in providing quality products and services that will satisfy the needs of the customer Information technology plays a critical role in effective development of ERP system As many businesses develop online marketplace it becomes even more important to develop a single view of transactions to all value chain partners including customers manufacturer suppliers and other vendors This book therefore adopts a focus on ERP and Supply Chain Management to develop better plans to better serve the customer It adopts a management and a systemic perspective of these issues and does not deal with the software

aspects of ERP The focus is on the fundamentals rather than on the advanced issues The book is intended to help managers executives and students to understand the basic concepts of ERP and Supply Chain Management **Disaster Risk**
