introductory description of the electron distribution in molecules Using mostly  $2 \times 2$  Hckel secular equations Chapter 2 by far the largest part of the book because of the many implications of the chemical bond introduces a model of bonding in homonuclear and heteronuclear diatomics multiple and delocalized bonds in hydrocarbons and the stereochemistry of chemical bonds in polyatomic molecules in a word a model of the strong first order interactions originating the chemical bond In Chapter 3 the Hckel model of the linear polyene chain is used to explain the origin of band structure in the 1 dimensional crystal Chapter 4 deals with a simple two state model of weak interactions introducing the reader to understand second order electric properties of molecules and VdW bonding between closed shells Lastly Chapter 5 studies the structure of H bonded dimers and the nature of the hydrogen bond which has a strength intermediate between a VdW bond and a weak chemical bond Besides a qualitative MO approach based on HOMO LUMO charge transfer from an electron donor to an electron acceptor molecule a quantitative electrostatic approach is presented yielding an electrostatic model working even at its simplest pictorial level A list of alphabetically ordered references author and subject indices complete the book
