HAMMER TYPE

Multi-Impact Spring Hammer

(24, 3000)

Jaques Hammer mills are built especially to reduce limestone and other relatively non-plastic materials to "fines" (200 mesh). Based on the new, spring-type hammer, featuring all their weight concentrated at the point of impact and rotating at high speed, these mills reduce the material with unusual efficiency. Low maintenance, prompt removal hammer plates in the hammer and free access to the point of impact of pulverizing is secured by an in the material before it reaches the crushing zone, thereby increasing wear on the hammers and grate.

These compact, sturdy mills, with latest bearing technique are made in six sizes ranging 12" to 36" diameter. The output capacity in tons per hour, high percentage of fine work, etc. are provided in discharge gate for operation are all to suit requirements. They can be installed either open top or enclosed for trouble-free, trouble-free operation are easily installed.

GYRATORY TYPES

Gyrax — Size 14"

Light Weight but Sturdy
High Efficiency
Low Feed Rate

The Gyrax Fine Reduction Crusher is a lightweight machine combining power strength with an unusually high efficiency.

The Traylor design of ball feed and spread mechanism fitted to these crushers eliminates feeding and grinding between crushing faces.

The construction is uncomplicated and easy to handle after bearings, and the eccentric shaft shaft and gears are all mounted in oil with buffer oil circulating pump served for a large oil reservoir.

These crushers are suitable for working at extremely fine settings, and by reason of their light weight, low feed rate and low power consumption are particularly adaptable for use with small portable crushing plants and specialized for crushing applications in process industries.

Can be equipped with either bar or conical driving pulley.

Traylor 'TY' and 'TZ'

Fine Reduction — Excellent Product
High Speed — Large Capacity
Low Overall Operating Costs

These crushers are manufactured under license to the Traylor Eng. & Mfg. Company of Birmingham, Ala. Sizes 12" and 14" crushers are compact machines combining both fine screen and ball feed mechanism. They are designed to handle material in excess of 1000 lbs. per hour, and are equipped with a ball feed and spread mechanism at all angles to the feed and spread without discharge and a self-contained mechanism internally fitted with roller bearings.

The same capacity and efficiency of Traylor Gyrotory Crushers is due to the advanced design of the ball feed and spread mechanism.

Crushing is assisted by increasing the capacity of each crushing feeding zone — power requirements are reduced, even at fine settings for producing a grade just below the 200 mesh, and in a closed crushing loop. The reduced clearance between material and crushing surfaces greatly increases the life of these parts. Ideal for secondary and tertiary crushing operations.

ROLL TYPE

Double Crushing Roll

(Construction and 10" diameter)

Crushing rolls will handle a wide range of materials, including those which cannot be handled successfully by other machines.

The product from crushing rolls is generally intermediate in size between that of the reduction crusher and grinding mill.

The spacing capacity of rolls being broken, they should be selected of ample diameter to produce the largest material in the feed.

These rolls will take fine feeds of crushing rolls for combining stages of service industry. They are usually run flat or with ball plates mounted on each roll shaft.

Roll shafts can be run in compression, tension, or in a sliding bed, or may be other means, fixed, compressed or rolled, according to the service required.

Roller buffers or springs are fitted to provide the necessary crushing pressure and protect the movable roll in case of should undesirable substances enter the machine.

Feeding Equipment

PLATE APRON TYPE

(12" to 36" wide — capacity 100 to 1000 tons per hour)

These feeders are manufactured with frames in the Jaques Eng. & Mfg. Company of Birmingham, Ala. and are designed for service in all climates, including the most severe. They are built of heavy steel plates, the main plates being on the top, to be supported by the bottom steel frame, and are arranged in a way to support the load uniformly for the full length of the feeder. In a subsequent apron assembly, delivery of the plate due to impact of heavy loads, rolls in the apron are supported by heavy pins and are supported by large steel rollers, running in slots having fully lubricated bearings, mounted in right hand of heavy steel frame sections.
