The three controllers achieve closed-loop H_2 norms of 1.04, 0.07 and 0.01, respectively. Conducted simulation results and compare the gains from root distribution to $\alpha_1, \alpha_2, \alpha_3$ for the positive and negative values of α . It shows that all three controllers reduce suspension deflection and body acceleration below the tolerance.

So far you have designed H_∞ controllers that meet the performance objectives for the nominal value discussed earlier. This model is only an approximation of the true situation and you need to make sure performance is maintained in the face of model errors and uncertainty. This is called robust performance. Next you *g*-synthesize to design *g*-controllers that achieve robust performance for the entire family of robust controllers (synthesized with the design function using the structured model errors) $\{C, D\}$ of “nominal” performance $\|G\|_\infty \leq 1$.

Because the normal response is a trade-off with the initial controller error, the responses are not obtained with the balanced H_2 criterion.
