

Unit 5 Geometry

Introduction to Similar

Scale Factor

A **scale factor** is a type of transformation that makes a figure larger or smaller without changing its shape.

The corresponding sides of an image and a preimage may be used to find the scale factor.

Consider a triangle with side lengths 3, 4, and 5. If the scale factor is 2, the new triangle will have side lengths 6, 8, and 10.

If the scale factor is $\frac{1}{2}$, the new triangle will have side lengths 1.5, 2, and 2.5.

Example:

Step 1: Find the scale factor.

Step 2: Use the scale factor to find the new side lengths.

Step 3: The new triangle has side lengths 6, 8, and 10.

Triangle Inequality Theorem

Definition: For the construction, you will need a compass and a ruler. Although you already use these instruments when constructing figures and exploring geometric relationships, there can be added to your toolbox a compass and straightedge to construct figures with given side lengths.

Step 1: Construct a triangle with side lengths 3 cm, 4 cm, and 5 cm.

Step 2: Use a ruler to measure the length of the longest side.

For the construction, you will need a compass and a ruler. Although you already use these instruments when constructing figures and exploring geometric relationships, there can be added to your toolbox a compass and straightedge to construct figures with given side lengths.

Construct a triangle with side lengths 3 cm, 4 cm, and 5 cm.
