Cowan,2021-07-23 Building on the material learned by students in their first few years of study Topics in Statistical Mechanics Second Edition presents an advanced level course on statistical and thermal physics It begins with a review of the formal structure of statistical mechanics and thermodynamics considered from a unified viewpoint There is a brief revision of non interacting systems including quantum gases and a discussion of negative temperatures Following this emphasis is on interacting systems First weakly interacting systems are considered where the interest is in seeing how small interactions cause small deviations from the non interacting case Second systems are examined where interactions lead to drastic changes namely phase transitions A number of specific examples is given and these are unified within the Landau theory of phase transitions The final chapter of the book looks at non equilibrium systems in particular the way they evolve towards

equilibrium This is framed within the context of linear response theory Here fluctuations play a vital role as is formalised in the fluctuation dissipation theorem The second edition has been revised particularly to help students use this book for self study In addition the section on non ideal gases has been expanded with a treatment of the hard sphere gas and an accessible discussion of interacting quantum gases In many cases there are details of Mathematica calculations including Mathematica Notebooks and expression of some results in terms of Special Functions
