

SELECTIVE MUTISM: KEY THINGS TO KNOW

INTRODUCTION

Selective mutism is a persistent failure to speak in specific social situations (e.g. at school), despite speaking fluently in familiar situations.

Children with selective mutism can appear socially withdrawn, oppositional, perfectionistic, or have an increased degree of emotional or sensory sensitivity.

Early intervention leads to better outcomes and reduces negative effects on social development, educational progress, and emotional health.

TREATMENTS

Psychologists and speech pathologists both play important roles in treating children with selective mutism.

Treatment usually involves a combination of behavioural, speech, and family therapies, teaching the child that they can have more control over their environment by using their words.

Community desensitisation is a program that exposes a child to communication situations with controlled, gradual increases in verbal expectations.

The goal of therapy is to reduce anxiety and increase confidence in speaking.

Therapy involves creative and fun activities (e.g. drawing, colouring, turn-based games), with natural consequences.

The desensitisation hierarchy involves four stages: nonverbal, ghost/whisper, motor/voice, and generalisation.

It's important there is a carryover in expectations at each stage in therapy to other contexts, such as at school and at home. Parents and teachers should be actively involved at all stages.

Speech pathologists often include oral language, speech or social goals into their activities to address secondary language or speech issues contributing to selective mutism.

Suffering in Silence Donna Mac LCPC, 2015-09-29 Selective mutism is an anxiety disorder and its currently one of the most misunderstood under diagnosed and undertreated mental health conditions When children with selective mutism feel expected or pressured to speak in social situations they become terrified Therefore their level of anxiety significantly increases but by remaining silent their anxiety level slightly decreases obtaining some relief for themselves For these children remaining silent is actually an ineffective coping mechanism or a maladapted solution to create a sense of safety within themselves Hence their mouths freeze and they are silent This is temporary relief but longitudinally these children suffer in silence Due to the fact that many children will display normative shy behavior or even socially anxious behavior at times it can be challenging to discern if the child's behavior falls within normal limits or if the child actually demonstrates clinically significant behavior signifying a selective mutism diagnosis This can be confusing for parents teachers and even clinicians This manual is meant to help clarify this distinction and will also assist you in figuring out how to seek help ask the right questions and what you can expect from early intervention services school based services and holistic therapeutic and psychiatric services
