The Regional Integration Manual Philippe De Lombaerde, Renato Flores, Lelio Iapadre, Michael Schulz, 2012-03-29 The Regional Integration Manual brings together different methods for monitoring and analysing regional integration processes in a systematic way Employing a multi disciplinary approach it seeks to provide officials in regional organisations researchers in think tanks academics and students worldwide with an accessible set of both quantitative and qualitative tools useful in their day to day work The Manual addresses an increasing demand for such tools in a world where mechanisms and ideas for effective regional government and governance are in dire need whereas the monitoring and analytical capabilities of official and non governmental actors often lag behind It also addresses a rapidly growing academic community studying the determinants depth speed and other characteristics of regional integration and co operation Employing a multi disciplinary approach The Regional Integration Manual will be of interest to scholars of governance and regional politics as well as policy makers and those in regional organisations

Methods and Models in Transport and Telecommunications Aura Reggiani, Laurie A. Schintler, 2006-03-30 One aspect of the new economy is a transition to a networked society and the emergence of a highly interconnected interdependent and complex system of networks to move people goods and information An example of this is the increasing reliance of networked systems e g air transportation networks electric power grid maritime transport etc on telecommunications and information infrastructure Many of the networks that evolved today have an added complexity in that they have both a spatial structure i e they are located in physical space but also an a spatial dimension brought on

largely by their dependence on information technology. They are also often just one component of a larger system of geographically integrated and overlapping networks operating at different spatial levels. An understanding of these complexities is imperative for the design of plans and policies that can be used to optimize the efficiency, performance, and safety of transportation, telecommunications, and other networked systems. In one sense, technological advances along with economic forces that encourage the clustering of activities in space to reduce transaction costs have led to more efficient network structures. At the same time, the very properties that make these networks more efficient have also put them at a greater risk for becoming disconnected or significantly disrupted when super-connected nodes are removed, either intentionally or through a targeted attack.

Dynamic General Equilibrium Modeling Burkhard Heer, Alfred Maußner, 2024-02-21 Contemporary macroeconomics is built upon microeconomic principles with its most recent advance featuring dynamic stochastic general equilibrium models. The textbook by Heer and Maußner acquaints readers with the essential computational techniques required to tackle these models and employ them for quantitative analysis. This third edition maintains the structure of the second, dividing the content into three separate parts dedicated to representative agent models, heterogeneous agent models, and numerical methods. At the same time, every chapter has been revised, and two entirely new chapters have been added. The updated content reflects the latest advances in both numerical methods and their applications in macroeconomics, spanning areas like business cycle analysis, economic growth theory, distributional economics, monetary and fiscal policy. The two new chapters delve into advanced techniques including higher-order perturbation, weighted residual methods, and solutions to high-dimensional nonlinear problems. In addition, the authors present further insights from macroeconomic theory, complemented by practical applications like the Smolyak algorithm, Gorman aggregation, rare disaster models, and dynamic Laffer curves. Lastly, the new edition places special emphasis on practical implementation across various programming languages; accordingly, its accompanying web page offers examples of computer code for languages such as MATLAB, GAUSS, Fortran, Julia, and Python.

Economic Modeling and Inference Bent Jesper Christensen, Nicholas M. Kiefer, 2021-07-13 *Economic Modeling and Inference* takes econometrics to a new level by demonstrating how to combine modern economic theory with the latest statistical inference methods to get the most out of economic data. This graduate-level textbook draws applications from both microeconomics and macroeconomics, paying special attention to financial and labor economics with an emphasis throughout on what observations can tell us about stochastic dynamic models of rational optimizing behavior and equilibrium. Bent Jesper Christensen and Nicholas Kiefer show how parameters often thought estimable in applications are not identified even in simple dynamic programming models, and they investigate the roles of extensions including measurement error, imperfect control, and random utility shocks for inference. When all implications of optimization and equilibrium are imposed in the empirical procedures, the resulting estimation problems are often nonstandard, with the estimators exhibiting nonregular asymptotic behavior such as short

ranked covariance superconsistency and non Gaussianity Christensen and Kiefer explore these properties in detail covering areas including job search models of the labor market asset pricing option pricing marketing and retirement planning Ideal for researchers and practitioners as well as students Economic Modeling and Inference uses real world data to illustrate how to derive the best results using a combination of theory and cutting edge econometric techniques Covers identification and estimation of dynamic programming models Treats sources of error measurement error random utility and imperfect control Features financial applications including asset pricing option pricing and optimal hedging Describes labor applications including job search equilibrium search and retirement Illustrates the wide applicability of the approach using micro macro and marketing examples

Economic Dynamics Ronald Shone, 2002-11-28 This is the substantially revised and restructured second edition of Ron Shone's successful advanced textbook *Economic Dynamics* The book provides detailed coverage of dynamics and phase diagrams including quantitative and qualitative dynamic systems continuous and discrete dynamics linear and non linear systems and single equation and systems of equations It illustrates dynamic systems using Mathematica Maple V and spreadsheets It provides a thorough introduction to phase diagrams and their economic application and explains the nature of saddle path solutions The second edition contains a new chapter on oligopoly and an extended treatment of stability of discrete dynamic systems and the solving of first order difference equations Detailed routines on the use of Mathematica and Maple are now contained in the body of the text which now includes advice on the use of Excel and additional examples and exercises throughout Supporting website contains solutions manual and learning tools
