

Elements & Macromolecules in Organisms

Most common elements in living things are carbon, hydrogen, nitrogen, and oxygen. These four elements constitute about 95% of your body weight. All compounds can be classified in two broad categories --- organic and inorganic compounds. Organic compounds are made primarily of carbon. Carbon has four outer electrons and can form four bonds. Carbon can form single bonds with another atom and also bond to other carbon molecules forming double, triple, or quadruple bonds. Organic compounds also contain hydrogen. Since hydrogen has only one electron, it can form only single bonds.

Each small organic molecule can be a unit of a large organic molecule called a macromolecule. There are four classes of macromolecules (polysaccharides or carbohydrates, triglycerides or lipids, polypeptides or proteins, and nucleic acids such as DNA & RNA). Carbohydrates and lipids are made of only carbon, hydrogen, and oxygen (CHO). Proteins are made of carbon, hydrogen, oxygen, and nitrogen (CHON). Nucleic acids such as DNA and RNA contain carbon, hydrogen, oxygen, nitrogen, and phosphorus (CHON P).

The body also needs trace amounts of other elements such as calcium, potassium, and sulfur for proper functioning of muscles, nerves, etc. Color each of the elements on the next page according to the color listed next to the element's symbol. Then Color code the squirrel with the correct proportion of each element's color. Now color code the carrot with the same colors as you used on the squirrel.

Meat Animals D. Lister, 2012-12-06 Dramatic shortfalls in crop production in various regions of the world have led some people to question the relatively inefficient use of cereal grains for feeding meat animals instead of their direct use for human food There is no doubt however that meat offers a nutritionally valuable attractive and widely accepted food the world demand for which increases daily Thus it is not enough simply to condemn the consumption of meat as an irresponsible extravagance rather it is preferable to examine how the demand for meat can be met most efficiently and effectively which requires a fundamental enquiry into how meat is grown The importance of fat for instance both to the growing animal and to the consumer needs to be established in view of the expense involved in its deposition by the animal and the extent to which it is discarded at many points in the chain from the slaughterhouse to the consumer We were aware that there existed a wealth of information on the physiology of growth which because of its having been collected as part of investigations in many other disciplines and the inevitable communication gap had not been incorporated into the science of animal production Similarly there were principles and techniques of animal husbandry which if known in other disciplines might enable more pertinent questions to be asked The biochemical and physiological pathways by which animals utilise feed to produce body protein fat and other components are intriguing problems which are receiving considerable attention

Supramolecular Materials and Technologies David N. Reinhoudt, 2008-04-30 Perspectives in Supramolecular Chemistry relates recent developments and new exciting approaches in supramolecular chemistry. The series covers all areas from theoretical and modelling aspects through organic and inorganic chemistry and biochemistry to materials, solid state and polymer sciences reflecting the many and varied applications of supramolecular structures in modern chemistry. From the early days of supramolecular chemistry, the field has been associated with possible applications. This is not surprising as the design of new molecules and later of assemblies of molecules is often function driven. Now after three decades of supramolecular chemistry, David Reinhoudt has brought together a collection of reviews to reflect on the applications that have actually been achieved. The first applications in molecular recognition are now established technologies in analytical chemistry, separation science and medicine. More recently, developments have taken place in material design and these concepts are also discussed here.

Contents: Self Assembling Systems on Scales from Nanometers to Millimeters; Design and Discovery; Dendritic Architectures; Supramolecular Structures with Macromolecules; Chemosensors; Synthetic Receptors in Analytical Sensing Applications; Selective Ion Recognition with Durable Sensors; Ion Separations in Membrane and Solid Phase Extraction Systems; Porphyrin and Expanded Porphyrin Based Diagnostic and Therapeutic Agents.

Supramolecular Materials and Technologies illustrates the achievements and advances that supramolecular chemistry has made in many fields from organic chemistry to materials science and from analytical chemistry to molecular biology.

Processes in Microbial Ecology David L. Kirchman, 2012-02-02 A final chapter is devoted to symbiosis and other relationships between microbes and larger organisms.

Biotic Type Antioxidants: the prospective search area for novel chemical drugs Gennady Zaikov, Parfenov, 2018-12-19 The discovery of molecular and cellular mechanisms of pathology together with the present data on drug treatment result in enhanced drug design and testing. The known mechanisms of biological activity as displayed by ascorbic acid and other natural reductones are the reason that they are considered to be physiologically compatible antioxidants, many of which are trace elements in food. The pharmacological potential of natural antioxidants may be enhanced by chemical modification. Biotic antioxidants possess an important potential to be a reliable basis of the development of new multipurpose drugs within the framework of existing technological structures. This book shows approaches for possible use of these natural antioxidants. In particular, such an approach is described for the case of the design of superoxide dismutase models with anti-tumour activity.
