Alim, 2017-12-12 This book emphasizes the use of four complex plane formalisms impedance admittance complex capacitance and modulus in a simultaneous fashion The purpose of employing these complex planes for handling semicircular relaxation using a single set of measured impedance data ac small signal electrical data is highly underscored The current literature demonstrates the importance of template version of impedance plot whereas this book reflects the advantage of using concurrent four complex plane plots for the same data This approach allows extraction of a meaningful equivalent circuit model attributing to possible interpretations via potential polarizations and operative mechanisms for the investigated material system Thus this book supersedes the limitations of the impedance plot and intends to serve a broader community of scientific and technical professionals better for their solid and liquid systems This book addresses the following highlighted contents for the measured data but not limited to the 1 Lumped Parameter Complex Plane Analysis LP CPA in conjunction with the Bode plots 2 Equivalent circuit model ECM derived from the LP CPA 3 Underlying Operative Mechanisms along with the possible interpretations 4 Ideal Debye and non ideal non Debye relaxations and 5 Data Handling Criteria DHC using Complex Nonlinear Least Squares CNLS fitting procedures *McGraw-Hill encyclopedia of science & technology* McGraw-Hill, 2002 **American Book Publishing Record**, 2005 **Fundamental Numerical Methods for Electrical Engineering** Stanislaw Rosloniec, 2008-07-17 Stormy development of electronic computation techniques computer systems and software observed during the last decades has made possible automation of data processing in many important human activity areas such as science technology economics and labor organization In a broadly understood technology area this development led to separation of specialized forms of using computers for the design and manufacturing processes that is computer aided design CAD computer aided manufacture CAM In order to show the role of computer in the rest of the two applications mentioned above let us consider basic stages of the design process for a standard piece of electronic system or equipment formulation of requirements concerning user properties characteristics parameters of the designed equipment elaboration of the initial possibly general electric structure determination of mathematical model of the system on the basis of the adopted electric structure determination of basic responses frequency or time domain of the

system on the base of previously established mathematical model repeated modification of the adopted diagram changing its structure or element values in case when it does not satisfy the adopted requirements preparation of design and technological documentation manufacturing of model prototype series according to the prepared documentation testing the prototype under the aspect of its electric properties mechanical durability and sensitivity to environment conditions modification of prototype documentation if necessary and handing over the documentation to series production The most important stages of the process under discussion are illustrated in Fig I 1 xi xii Introduction Fig I
