N. Rozvany,2013-11-21 G I N Rozvany ASI Director Professor of Structural Design FB 10 Essen University Essen Germany Structural optimization deals with the optimal design of all systems that consist at least partially of solids and are subject to stresses and deformations This inte grated discipline plays an increasingly important role in all branches of technology including aerospace structural mechanical civil and chemical engineering as well as energy generation and building technology In fact the design of most man made objects ranging from space ships and long span bridges to tennis rackets and artificial organs can be improved considerably if human intuition is enhanced by means of computer aided systematic decisions In analysing highly complex structural systems in practice discretization is un avoidable because closed form analytical solutions are only available for relatively simple idealized problems To keep discretization errors to a minimum it is de sirable to use a relatively large number of elements Modern computer technology enables us to analyse systems with many thousand degrees of freedom In the optimization of structural systems however most currently available methods are restricted to at most a few hundred variables or a few hundred active constraints *Optimal Trajectory Planning and Train Scheduling for Urban Rail Transit Systems* Yihui Wang,Bin Ning,Ton van den Boom,Bart De Schutter,2016-04-21 This book contributes to making urban rail transport fast punctual and energy efficient significant factors in the importance of public transportation systems to economic environmental and social requirements at both municipal and national levels It proposes new methods for shortening passenger travel times and for reducing energy consumption addressing two major topics 1 train trajectory planning the authors derive a nonlinear model for the operation of trains and present several approaches for calculating optimal and energy efficient trajectories within a given schedule and 2 train scheduling the authors develop a train scheduling model for urban rail systems and optimization approaches with which to balance total passenger travel time with

energy efficiency and other costs to the operator Mixed integer linear programming and pseudospectral methods are among the new methods proposed for single and multi train systems for the solution of the nonlinear trajectory planning problem which involves constraints such as varying speed restrictions and maximum traction braking force Signaling systems and their effects are also accounted for in the trajectory planning model Origin destination passenger demand is included in the model formulation for train scheduling Iterative convex programming and efficient bi level approaches are utilized in the solution of the train scheduling problem In addition the splitting rates and route choices of passengers are also optimized from the system point of view The problems and solutions described in Optimal Trajectory Planning and Train Scheduling for Urban Rail Transit Systems will interest researchers studying public transport systems and logistics whether from an academic or practitioner background as well as providing a real application for anybody studying optimization theory and predictive control   *Shell and Spatial Structures* Stefano Gabriele,Amedeo Manuello Bertetto,Francesco Marmo,Andrea Micheletti,2023-10-31 This volume collects the latest advances innovations and applications in the field of shell and spatial structures as presented by leading international researchers at the 2nd Italian Workshop on Shell and Spatial Structures IWSS held in Turin Italy on June 26 28 2023 The conference was meant to give an overview on experimental and theoretical studies analysis methods and approaches for the design computational form finding structural optimization manufacturing testing and maintenance techniques and historical reviews of all types of shell and spatial structures These include but are not limited to tension and membrane structures framed and lattice structures gridshells and active bending structures shell roofs tensegrity structures pneumatic and inflatable structures active and deployable structures concrete metal masonry timber and bio based spatial structures The contributions which were selected by means of a rigorous international peer review process present a wealth of exciting ideas that will open novel research directions and foster multidisciplinary collaboration among different specialists   OUR FRAGILE WORLD: Challenges and Opportunities for Sustainable Development - Volume I M.
