As a result, the authors conclude that the current policy does not appear to be working and suggest that the current policy should be revised.

As mentioned previously, the results of the study are striking, but there are some caveats. First, the sample was relatively small, and the results may not be generalizable to other populations. Second, the study was cross-sectional, and it is possible that the results may be influenced by other factors. Finally, the study did not control for potential confounding factors, such as age, gender, and education level. Despite these limitations, the study provides valuable insights into the relationship between social media use and mental health.
